It is a white crystalline solid slightly soluble in cold water, having a sweetish alkaline taste. It occurs in nature in solution in the water of lakes in Tibet, Tatar, China, and California, and is obtained from these waters by evaporation and crystallization. The United States is now almost wholly supplied with borax from California. Borax is also prepared artificially from soda and boracic acid. It is much used as a flux in glass-making operations and for cleaning the surfaces of difficultly fusible metals previous to soldering, since when melted it dissolves the metallic oxides which form on their surfaces when heated. It is also used in glass and enamel manufacture as an antiseptic, particularly in foods, to cause its action on the system is feeble even in comparatively large doses; and as a detergent. bore² (bôr), *n.* [Early mod. E. also *boar*, *boer*; appar. < ME. *bare*, a wave, billow (once, in doubtful use) (cf. F. *barre*, a bore); prob. < Icel. *bara* = Norw. *baara*, a billow caused by wind; cf. Sw. dial. *bår*, a hill, mound; prob. connected with Icel. *bæra* = E. *bear¹*.] An abrupt tidal wave which breaks in an estuary, the water then rushing up the channel with great violence and noise. The tidal wave being a wave of translation, the shoaling and narrowing of channels where the tide rises very rapidly produce a great increase in the height of the wave. The forward parts of the wave, too, in shoaling water advance less rapidly than the backward parts, and so cause a great accumulation in front. The most celebrated bores in the old world are those of the Ganges, Indus, and Brahmaputra. The last is said to rise to a height of 12 feet. In the Amazon and other rivers in Brazil the bore reaches a height of from 12 to 16 feet. In England the bore is observed more especially in the Severn, Trent, and Wyre, and in the Solway Firth. The bores in some bays at the head of the Bay of Fundy are very remarkable. In some parts of England it is called *cauer* (which see); on the Amazon, the *pororoca*; on the Seine, the *barrée*; and on the Garonne and Gironde in France, the *marécaud*.

When the rise of the tide begins, the surface of the water is disturbed in mid-channel; but the water is not broken, it is merely like a common wave. But as this rapid rise elevates the surface suddenly above the level of the flat sands, the water immediately rushes over them with great velocity, and with a broken front, making a great noise. And this is the whole of the *bore*.

Airy, Encyc. Metrop., Tides and Waves, p. 514.

bore³ (bôr), *v. t.*; pret. and pp. *bored*, ppr. *boring*. [This word, verb and noun (the noun in senses 1 and 2 appar. preceding the verb), came into use about the middle of the 18th century; usually considered a particular use of *bore¹*, and compared with G. *drillen*, bore, drill, also bore, weary; but an immediate derivation from *bore¹* is philologically improbable, though it may be explained as a twist of fashionable slang (to which, indeed, the word has always belonged), perhaps resting on some forgotten anecdote. At any rate, the word is now independent of *bore¹*.] **1.** To weary by tedious iteration or repetition; tire, especially in conversation, by insufferable dullness; tease; annoy; pester.

The auger or bit may be fixed, or may have a slight journal movement as the work proceeds. The block-boring machine is an apparatus consisting of two augers driven by hand and a vise for holding the bolt of wood from which a block is to be made. L. vesci, eat.*] The science of plants. It treats of the forms of plants, their structure, the nature of the tissues of which they are composed, the vital phenomena common to them, the arrangement of them into larger and smaller groups according to their affinities, and the classification of these groups so as to exhibit their mutual relations and their position in the vegetable kingdom as a whole. The science further investigates the nature of the vegetation which at various epochs lived on the earth, as well as the distribution of plants at the present time. It is thus divided into several sections. (*a*) *Structural or morphological botany*, that branch of the science of botany which relates to the structure and organization of plants, internal or external, independently of the presence of a vital principle. Also called *anatomy*. (*b*) *Physiological or biological botany*, that branch which relates to the history of vegetable life, the functions of the various organs of plants, and their minute structure and method of growth. (*c*) *Descriptive botany*, that branch which relates to the description and nomenclature of plants. Also called *phenology*. (*d*) *Systematic botany*, that branch which relates to the principles upon which plants are to be classified or arranged with reference to their natural relationships. The system of classification now generally adopted is that proposed by Antoine Laurent de Jussieu and improved and enlarged by DeCandolle, Brown, and others. It is generally called the *natural system*, because it is intended to express, as far as possible, the various degrees of relationship among plants as they exist in nature, and to group next to each other the various genera, species, and orders which are most closely related to each other. Artificial systems have been proposed, but of late years it has been the modification of the natural system and the best known is that of Linnaeus, which is based on the structure and habits of plants. This system, which is now almost universally adopted, is only temporarily placed at the head of the science of botany, but it has been found that it is not only a partial and artificial system, but also a very imperfect one. (*e*) *Geographical botany*, that branch which relates to the geographical distribution of plants, and the causes which have produced the same. (*f*) *Palaeobotany*, that branch which embraces the study of the plants which lived on the earth in the various strata of which the earth is composed.

2. A weapon consisting of a strong strip of elastic wood or other elastic material, with a string stretched between its ends, used for shooting arrows. When the bow has been bent to its full extent by pulling the string back from it, the recoil of the string (against the inner side of which the notch of the arrow is placed) when released impels the arrow. The bow and arrow have been used in all ages and by many peoples as a weapon, and, though superseded in the advance of civilization by firearms, are still in use among savage tribes, and are the officially recognized weapon of the Manchu garrisons of China, where archery is still one of the subjects of examination for officers in the regular army. Bows were at one time divided into *longbows* and *crossbows*. During the middle ages the nations of Europe used longbows of 5 or 6 feet in length, the shorter ones being used by horsemen, and the longer by the foot-archers. The bows now commonly used in archery are of two kinds, the single-piece bow, or self-bow, and the back or union bow. The single-piece bow is made of one rod of hickory, lancewood, or yew, the last, if perfectly free from knots, being considered the most suitable wood. These, being rubbed with resin and drawn over the strings of the instrument, cause it to sound. Unknown in the older sacred literature, Brahma becomes by degrees an object of adoration to the Brahmans, and is artificially combined into a trimurti or trinity with Vishnu and Siva, being regarded as Creator, while Vishnu is Preserver, and Siva is Destroyer. Brahma was never worshiped by the people, and only one temple sacred to him is known. tissue; the encephalon (which see); the part of the cerebrospinal axis which is contained in the cranium. It is divided by anatomists into (1) the *prosencephalon*, comprising the cerebral hemispheres (or lateral halves of the cerebrum) with the olfactory lobes; (2) the *mesencephalon*, comprising the thalami optici, and other parts about the third ventricle; (3) the *metencephalon*, comprising the pons Varolii, and the cerebellum and pons; (4) the *myelencephalon*, comprising the medulla oblongata, extending from the pons to the foramen magnum. The prosencephalon is now usually divided into the *rhinencephalon*, or olfactory lobes, and *prosencephalon* proper. The thalamencephalon is also called *dienecephalon*. By Hux-

Base of Human Brain.

A, frontal lobe of cerebrum; B, temporal lobe of same, separated from A by the Sylvian fissure; C, corpus callosum; its lower end; D, cerebellum; E, medulla oblongata; F, pituitary body; G, olfactory nerve (so called—rather olfactory lobe, or rhinencephalon); H, optic nerve, after decussation with its fellow at the chiasm; I, trochlear nerve; J, pathetic nerve; K, trigeminal trifid nerve; L, abducent nerve; M, facial nerve; N, auditory nerve; O, glossopharyngeal nerve; P, pneumogastric nerve; Q, spinal accessory nerve; R, hypoglossal nerve. The rounded masses near H are the corpora albicantia; I, T rests upon the pons Varolii.

ley and others the encephalon of the above nomenclature is called *metencephalon*, and the next segment (the fifth) is then named *metencephalon*. Common English equivalents of the above five segments are *forebrain*, *midbrain*, *hindbrain*, and *afterbrain*; these are terms translated directly from the nomenclature of the German anatomists, who call them respectively *vorder-hirn*, *mittel-hirn*, *hint-hirn*, and *nach-hirn*. Haeckel calls them *protencephalon*, *mesencephalon*, *metencephalon*, and *epiencephalon*. These five segments are fundamentally distinct, and correspond embryologically to as many cerebral vesicles or brain-bladders which arise from three primitive vesicles by subdivision. The simplest and a common division of the brain is into the *cerebrum* or brain proper, the *cerebellum* or little brain, the *pons Varolii*, and the *medulla oblongata*. (See cuts under *cerebral* and *corpus*.) The human brain is distinguished for the relatively enormous size and surface-complexity of the cerebrum or prosencephalon, which completely covers the cerebellum and olfactory lobes, and is marked by many deep fissures or sulci separating gyri or convolutions. The cerebrum is divided into right and left halves, or cerebral hemispheres, connected by the great transverse commissure or corpus callosum. Each hemisphere is divided into three primary lobes, frontal, parietal, and occipital, and many more detailed subdivisions of its surface are recognized. The interior of the adult by a set of primitively hollow is traversed in the adult by a set of system of connected cavities known as *ventricles* or *cavities*. The first and second of these are the right and left ventricles of the hemispheres, or *proventricles*; the third is the *diacavities*; the fourth is the *epicavities*; passages connecting these are the foramina of Monro and the aqueduct of Sylvius. The brain and adjoining portions of the spinal cord give rise to 12 pairs of nerves, called *cranial nerves*, because they emerge from foramina in the base of the skull. (See *cranial*.) Brain substance is of two kinds, gray ganglionic or cellular nerve tissue, and white commissural or fibrous nerve-tissue. The gray matter which invests the cerebrum and cerebellum is also called the *cortical* substance, in distinction from the white or *medullary* substance of the interior. A brain is in fact a collection of gray ganglia united by white commissures. Besides the cortex, there are several ganglia or collections of gray matter in the interior, as the corpora striata, the optic thalami, the optic lobes or corpora quadrigemina, the corpora dentata of the cerebellum, and the corpora olivaria of the medulla oblongata. Connected with the brain are two non-nervous structures, the conarium or epiphysis cerebri and the pituitary body or hypophysis cerebri. The brain is covered by three membranes or *meninges*, of which the external is the dura mater, the middle the arachnoid, and the inner the pia mater. Most mammals have a brain like that of man, but in descending the mammalian scale the cerebrum becomes relatively smaller and has fewer if any convolutions, the corpus callosum becomes rudimentary, and the olfactory lobes enlarge. (See cuts under *quercus* and *suleus*.) In the brain of birds the hemispheres are smooth, there is no corpus callosum or pons Varolii, and the optic lobes are of immense size. There is no brain in the lowest vertebrate, *Amphioxus*. The average weight of the brain in adult males of the European type is about 1,400 grams (49.5 ounces); in women about 1,250 grams (44 ounces). The brain is in its highest activity the organ of consciousness or mind, and its general function is that of furnishing the most complex and extensive outgoing stimulation of muscles and other active tissues as a response, more or less immediate, to the most complex and extensive incoming sensory stimulation. With functions of this high degree of complexity are associated in some parts much simpler functions resembling those of the spinal cord. The cortex of the cerebral hemispheres is the portion of the brain in which the most complex coordinations seem to be effected, and which is most directly involved in mental acts. Certain parts of the cortex are, however, peculiarly related to certain special incoming or outgoing stimulations, and are called sensory or motor centers. (See *cerebral*, and *cerebral localization*, under *localization*.) The corpus striatum is usually regarded as especially concerned with stimulations passing downward, and the optic thalamus with those passing upward; among

the latter, those of sight are connected with the hinder part of the thalamus. The nates are involved in the sight, function, and the testes seem to have close relations with the stimuli entering by the auditory nerve. The cerebrum is concerned with the coordination of muscular contractions in the carrying out of voluntary actions, while the medulla oblongata contains a large number of centers for comparatively simple functions, as vasomotor action, cardiac action, respiration, deglutition, etc. (See also cut under *encephalon*.) From its complexity, the brain is usually spoken of in the plural in certain relations; as, to beat out of to lack one's *brains*.

2. In *entom.*, the principal ganglion of the nervous system, situated in the head, over the esophagus, and formed by the coalescence of several supra-esophageal ganglia. The nerves of the eyes and antennae are directly connected with it, and it gives off two inferior branches which surround the esophagus and unite beneath in the subesophageal ganglion. Sometimes this ganglion is regarded as a part of the brain, being distinguished as the *cerebrum*, while the principal or upper ganglion is called the *cerebrum*. 3. The same or a corresponding portion of the nervous system in many other invertebrates.— 4. Understanding; intellectual power; fancy; imagination; commonly in the plural; as, a man of *brains*; "my brain is too dull," Scott.

brass¹ (bräs), *n.* and *a.* [*< ME. bras, bres*, < AS. *bræs*, *brass*, = Icel. *bras* (Haldorsen), solder (> Gael. *prais* = Ir. *bras* = W. *pres*, *brass*); related to Icel. *brasa*, harden in the fire, = Sw. *brasa*, flame, = Dan. *brase*, fry, > F. *braser*, solder (see *braze*¹); cf. OSw. and Sw. *brasa*, fire, Icel. *brass* (occurring once), a cook. Hence *braze*², *brazen*, *brassen*, etc.] **I. n. 1.** An important alloy, consisting essentially of copper and zinc. The proportion in which the two metals are combined differs considerably in different kinds of brass. Brass in general is harder than copper, and consequently wears better than that metal. It is malleable and ductile, so that it can be easily rolled into thin sheets, or be hammered into any desired shape. It turns easily in the lathe, and can be drawn into fine wire; moreover, it has an attractive golden color, and is cheaper than copper. The color of brass varies with the proportions of the ingredients. A full yellow variety contains about two parts of copper to one of zinc. This alloy was known to the ancients, and was made by them before they had any knowledge of the metal zinc as such. It is not among the metallic substances mentioned by Homer; but it was well known to Strabo, who describes the mode of manufacturing it from the zinciferous ore (calamin), and calls the alloy *orichalc* (ὀρεχαλκος). See *orichalc*, *pinchbeck*, *prince's metal*, *mosaic gold*, *Muntz's metal*, and *yellow metal*. In rhetorical comparisons, brass is a common type of hardness, durability, or obduracy.

In *medieval archaeol.*, a funeral monument consisting of a plate of brass, usually of rectangular shape and often of large size, incised with an effigy, coats of arms, inscriptions, and frequently accessory ornament. Such *brasses* are sometimes splendidly enamelled. In some examples the designs are executed in relief, or in relief in combination with engraving. Slabs of stone inlaid with figures, etc., in brass are also called *brasses*, and are a usual form of medieval monument. Both the plates of brass and the inlaid stones were frequently placed in the ordinary pavement of churches. Comparatively few of such monuments executed wholly in brass survive, as the value of the metal has caused it to be melted down and applied to other uses.

-Syn. 1. *Gallant, Valiant, Courageous, Brave, Heroic*, valorous, dauntless, chivalrous, doughty, resolute, manful. *Gallant*, splendid in dress or qualities, is most appropriately used with regard to courage which exhibits itself in deeds attracting attention and applause; of the first four words it is that which may have in it most of compliment and least of high commendation, but it is often a strong word, expressing splendid bravery in action: as, he was a *gallant* officer. *Valiant* is also brave in action, especially in opposing physical force, as in battle. The word is now elevated and poetic. *Courageous* denotes the possession of that spirit which enables one fearlessly and with full presence of mind to face danger. *Brave* is the most comprehensive of the words; it may denote the possession of the highest and noblest kind of courage and fortitude, of that spirit which enables a man to bear up against evil and danger, as well as to go forth to face it. *Courageous* has much of this breadth of meaning, but is applicable rather to doing than to enduring; *brave* is both passive and active. *Heroic* combines the meaning of all the other words in the superlative degree. It indicates a lofty superiority to fear, a noble self forgetfulness, an almost superhuman power to dare, achieve, or suffer. It bears the same relation to the other words that *sublime* bears to *great*, *grand*, or *lofty*.

n. 1. An alloy of which copper forms the predominating portion, and into the composition of which tin almost always enters; but the name is also given to alloys containing no tin. The proportion of copper in various bronzes is usually between 80 and 90 per cent.; in some it falls as low as 70. The proportion of tin in the bronzes of different ages and those used for various purposes is almost as variable as that of copper. Bronze used for bells has the largest amount of tin; in some it reaches 25 per cent. The bronze formerly used for cannon contained about 10 per cent. of tin and often a small amount of zinc. Statuary bronze is, and has been from the beginning of its use for the purpose, of very variable composition. In some statuary called bronze there is less than 1 per cent. of tin, while zinc is present in sufficient quantity almost to justify calling the material brass. The zinc in various pieces of statuary cast within the past two or three hundred years, and erected in some of the principal cities of Europe, varies in quantity from less than 1 per cent. to 25. Lead is present in many bronzes, but usually in small amount, rarely being as much as 3 per cent. Bronze is an alloy of importance to both the arts and commerce, and is also of great historical interest, since it has been known from remote ages over a large part of the world. It is preferred to simple unalloyed copper, on account both of its color and of its greater durability. Among prehistoric races the use of bronze preceded that of iron; and among their remains are found swords, axes, and other cutting instruments of this material, sometimes artistically made and ornamented, as well as domestic implements and utensils of many kinds. The ancient Greeks, Romans, etc., made statuary of it in enormous quantities, and also coins, recording tablets, and a great variety of articles of common use. It is now not only used for cannon (for which purpose it has been to a great extent supplanted by steel), bells, and statuary, but also for parts of various machines, especially bearings, and for screw-propellers. The beauty and durability of bronze statuary depend in no small degree on the color and composition of the oxidized film or incrustation which forms upon it when it is exposed to the weather. This is called its *patina* (which see). In recent times numerous experiments have been made with a view to improve the quality of bronze in various ways, in particular by the addition of small quantities of other substances, especially metals. The most important result of these experiments seems to be *phosphor-bronze*, an alloy patented by two Belgian metallurgists about 1870, and now extensively used where toughness and resistance to wear are required. The amount of phosphorus in phosphor-bronze is less than 1 per cent., and the effect it produces is probably due to its reducing action on the oxids of the other metals during the process of manufacture. Phosphor bronze is of finer grain and color, and is believed to be much more durable than ordinary bronze; and it is thought by many that it will eventually be proved to be the best material for artillery. Extensive experiments have also been made with manganese, lead, and other metals. *Aluminous bronze* is an alloy of copper and aluminum now in use, especially where tensile strength is required. So-called *steel bronze* is bronze hardened by mechanical compression. It has not come into general use, but was introduced by its inventor to be used for cannon. See *aluminous*.

=Syn. Bulky, Massive, Massy, Ponderous, Burly. Bulky refers to prominence, excess, or unwieldiness of size; it applies properly to material things; if applied to persons, it implies the development of physical size at the expense of higher qualities. Massy is, strictly, poetic for massive. The two denote weight and solidity quite as much as size, while that which is bulky may be hollow and comparatively light: as, a bulky bundle of straw; a massive jaw; "ingots of massy gold." Ponderous primarily denotes weight and not size, but has come to have a secondary suggestion of unwieldiness. Burly is applicable only to persons, and expresses bigness, solidity, and force, with something of coarseness of manner.

In 1603, Jonson produced his mighty tragedy of Sejanus, a noble piece of work, full of learning, ingenuity, and force of mind in wielding bulky materials.

bull⁴ (bŭl), *n.* [*<* ME. *bulle*, *<* OF. *bulle*, F. *bulle* = It. *bolla*, *bullo* = D. *bul*, *bulle* = G. Dan. *bulle* = Sw. *bullo* = Icel. *bola* (in *bann-bola*, a bull of excommunication, *<* ML. *bullo*, a papal edict, any edict or writing, a seal, L. *bullo*, a boss, knob, stud, bubble; *see* *bullo*, *bullo*, *bullet*, *bulletin*, *bolle*, *bolle*, etc.)] 1. Same as *bullo*, 2.—2. The most authoritative official document issued by the pope or in his name: usually an open letter containing some decree, order, or decision relating to matters of grace or justice.

It derives its name from the leaden seal (Latin *bullo*) appended to it by a thread or band, which is red or yellow when the bull refers to matters of grace, and uncolored and of hemp when it refers to matters of justice. On one side of the seal is the name of the pope, and on the other are the heads of St. Peter and St. Paul. Bulls are written in Latin, either in the ordinary cursive hand or in round Gothic characters, and have a red seal on the parchment itself, in which the name of the pope encircles the heads of the apostles. They begin with the name of the pope, followed by the term *episcopus* (bishop) and the words *servus servorum Dei* (servant of the servants of God) and a salutation, and close with the place and date of execution and the subscription of the chancellor or other functionary of the papal chancery. The distinctive name of a bull is taken from the first word or words of the general introduction which follows the salutation: as, the bull *Unigenitus*, which begins with the words *Unigenitus Dei*, etc., issued in 1713 by Clement XI., condemning the Jansenist propositions set forth in Quesnel's "Moral Reflections."

A brief, though of equal authority with a bull, differs from it in several important points, chiefly of form. It is shorter, relates to subjects of inferior importance, is written in Latin in ordinary Roman letters and on the smooth side of the parchment, uses the word *papa* instead of *episcopus* in the introductory formula, is sealed with red wax instead of lead, and with the pope's private seal, the fisherman's ring, and is never signed by the pope himself, but by a secretary of the papal chancery. Both bulls and bulls belong to a class of papal documents generically called *apostolic letters*; these are *encyclical* when addressed to the bishops of the Roman Catholic world, and from their contents are called *constitutions*, *decrets* (ancient), *synodal letters* (also ancient), *rescripts*, *motus proprii*, etc. Consistorial bulls are issued after consultation with the consistory of cardinals, and are signed by all the cardinals consulted.

The church published her bulls of crusade and offering liberal indulgences to those who served.

3. An official letter; an edict; especially, an imperial edict under the Roman or the old German empire.—Golden bull, a name given to several celebrated historical documents from their golden seal. The most notable of these is an edict or imperial constitution made in 1356 by the emperor Charles IV., regulating the mode of procedure in the election and coronation of the emperor.—Leaden bulls, the designation of official documents (from their leaden seals) sent by the emperors of Constantinople to patriarchs and princes, by the grandees of the empire, of France, Sicily, etc., and by patriarchs and bishops.

bull⁶ (bŭl), *n.* [Not found earlier than the 17th century, except as ME. *bul* (about A. D. 1320) in the doubtful passage first quoted. Origin uncertain. Several anecdotes involving Irish speakers have been told (and appar. invented) to account for the word. It is usually associated with *bull*, a papal edict, in allusion, it is said, to the contrast between the humble professions of the pope, as in his styling himself 'servant of servants,' and the absolutely dictatorial nature of his edicts. This explanation, which rests partly on the passage quoted from Milton (cf. *bullish*, also in Milton), below, is hardly tenable on historical grounds. The Icel. *bul*, nonsense, *bullo*, talk nonsense, chat, is mod., and, if not from the E. word, is to be associated with *bullo*, boil, and ult. with L. *bullo*, a bubble: *see* *bull*, 3.] A gross inconsistency in language; a ludicrous blunder involving a contradiction in terms: commonly regarded as especially characteristic of the Irish, and often called an Irish bull.

An ornament in the form of a capsule or locket, in use among the ancient Romans, who adopted it from the Etruscans. It was worn especially around the neck as an amulet by Roman children, both boys and girls, its protective virtue being supposed to reside either in its precious material or in some substance inclosed within it. It was of gold in the families of the nobly born and the rich, and of commoner material among others. It was laid aside by young men upon attaining maturity, and dedicated to Hercules or to the household lares; by young women it was dedicated to Juno.

Burden of proof, in law, the obligation resting upon one of the parties to an action to establish an alleged fact by proof under penalty of having judgment given against him, according to the presumption recognized by the law of evidence in case he adduces no proof. The burden of proof is said to be shifted when the party upon whom it lay has produced sufficient evidence to turn the presumption in his favor. Two circumstances are essential to the existence of a burden of proof: first, there must be a question of fact between two parties before a tribunal which will render a decision whether there is any particular evidence or not; and second, this decision must be governed by rules of presumption, more or less artificially extended so as to lead to a determination in every case. In unimportant controversies there will or will not be a burden of proof, or the burden of proof is not at all essential. In important cases, as in criminal trials, the burden of proof is not at all essential. In important cases, as in criminal trials, the burden of proof is not at all essential. The most ancient, perhaps, of the franchises was that depending on *burgage* tenure; this was exactly analogous in origin to the freeholder's qualification in the counties; but as the repressive principle extended, the right of a *burgage* vote had become in many places attached to particular houses or sites of houses, probably those which were originally liable for a quota of the *firma burgi*.

Stubbs, Const. Hist., § 745.

(b) In Scotland, that tenure by which the property in royal burghs is held under the crown, proprietors being liable to the (nominal) service of watching and warding; or, as it is commonly termed, "the service of burgh, used and wont." (c) The property so held.

A single bunch of the fruit weighs more than one hundred pounds. The trees grow in vast numbers on swampy land, from southern Brazil to the West Indies. The natives cut them down, and make cavities in the stems to obtain the sweet sap which accumulates in them; if allowed to ferment, a vinous liquor may be made from this sap, and even sugar has been obtained from it. Hence the name *wine-palm*, commonly given to the tree. The pulp between the nut and the outer covering of the fruit is sometimes eaten, and a beverage is prepared by rubbing the pulp in water. The pith of the leaf-stem is used in lieu of cork, and its hard covering for making baskets. Cords are made of fibers from the young leaves, and rough thatches are constructed of the older leaves.

The imperial bushel legally established in Great Britain in 1826 has a capacity of 2,218.192 cubic inches, and holds 80 pounds avoirdupois of distilled water at the temperature of 62° F. with the barometer at 30 inches. Previous to this the Winchester bushel had been the standard measure from Anglo-Saxon times; its capacity was 2,150.42 cubic inches. The measures of capacity of the United States are founded on the Winchester bushel, the imperial system having been created since the separation of the two countries. The name *Winchester bushel* is derived from the fact that the ancient standard bushel-measure of England was preserved in the town-hall of Winchester. Numerous bushels were in use in England at the time of the adoption of the imperial system. Thus, by a statute of Anne, a bushel of coals is to contain a Winchester bushel and a quart of water, to be 19½ inches in diameter, and to be heaped in the form of a cone 6 inches high. Various equivalent weights of different commodities had also been made bushels by law. Many of the American States have established equivalent weights, which vary considerably in different States. III. *conj.* 1. Except; unless: after a clause containing or implying a negation, and introducing the following clause, in which (the verb being usually omitted because implied in the preceding clause) but before the noun (subject or object of the omitted verb) comes to be regarded as a preposition governing the noun.

 And *but* for that our lives were blest.

 favour his doniges. *Spenser, State of Ireland.*

Browning, Last Ride Together.

In this construction the negative, being implied in *but*, came to be omitted, especially in connection with the verb *be*, in the principal clause, the construction "There is *not* but one God," as in the first example, becoming "There is *but* one God," leaving *but* as a quasi-adverb, "only, merely, simply." This use is also extended to constructions not originally negative.

If God would give the goodes only to good men, than
 would folke take occasion to scerne him but for them.

Sir T. More, Comfort against Tribulation (1573), fol. 35.

 Stood the Sulphur *but* to die. *Whittier, The Hero.*

To the last two constructions, respectively, belong the idioms "I cannot *but* hope that," etc., and "I can *but* hope that," etc. The former has suffered ellipsis of the principal verb in the first clause: "I cannot do anything *but* hope," or "anything else than hope," or "otherwise than hope," etc., implying constraint, in that there is an alternative which one is mentally unable or reluctant to accept, *but* being equivalent to *otherwise than*. The latter, "I can *but* hope that," etc., has suffered further ellipsis of the negative, and, though historically the same as the former, is idiomatically different: "I can only hope that," etc., implying restraint, in that there is no alternative or opportunity of action, *but* being equivalent to *only*, not *otherwise than*, or *no more than*.

I cannot but remember such things were,
 That were most precious to me. *Shak., Macbeth, iv. 3.*

 So earnestly, that if it were not true,
 The gods would not endure him.

 as any in the world. *Steele, Spectator, No. 6.*

 less" (these phrases having of course also their analytical
 meaning, with *but* in its adverbial use).

NGr. *βούριν*, a pan for salting meat). As in other vessel-names, the precise application varies in the different languages. In the sense of a particular measure of wine, the word is modern; cf. *pipe* in similar senses.] 1†. A leathern bottle or flask; a bucket: in this sense only in Middle English, usually spelled *bit* or *bitt*.

English Gilds (E. E. T. S.), p. 582.

2. A large cask, especially one to contain wine.—3. A measure of wine equal to 126 United States (that is, old wine) gallons; a pipe. It is no longer a legal measure in Great Britain, and the common statement that an imperial butt is 126 imperial gallons is incorrect; the butt is 110 imperial gallons. The measure was originally used chiefly for Spanish wine, and the word was used to translate Spanish *bota*, which equaled 126 United States gallons, and to distinguish that from the Spanish *pipa*, which contained only 114 United States gallons. Its present value was legalized by a statute of Anne. It is now confounded with the *pipe*. The pipe of Madeira is reputed to contain 110 gallons; of Canary, 120; of Port, 138; of Marsala, 112. The *bota* and *pipa*, throughout Spain, vary but little from the values above given. In Portuguese countries two measures are common, one of 141 gallons (Oporto, Lisbon for oil), and another of 119 gallons (Lisbon, Madeira, Porto Rico, Bahia). There is besides a Portuguese pipe of 132 gallons (Lisbon for oil, Bahia). In Italy the name *butte* is applied to a cask holding 200 United States gallons or more; but it was in many places confounded with the *pipa*, which held only 160 to 170 gallons. The French word *boute* was never used as the name of a wine measure; neither was the German *butte* or *bütte*. In Denmark there was a *bottle* of 123 United States gallons; in Gotha, a measure of the same name equal to 115 United States gallons. The *bota* of Bolivia is only 9.3 United States gallons. A butt of London beer, at the time when London beer was measured differently from ale, was 3 hogsheads. A butt of salmon, by a statute of Henry VI., was 84 gallons.

butte (büt), *n.* [F., a rising ground, a mound, orig. a butt to shoot at: see *butt*².] A conspicuous hill or mountain, especially one that attracts attention by its isolation, or serves as a landmark: a name applied in the regions about the upper Missouri and west to the Pacific. Thus, the "Three Buttes" were a conspicuous landmark for emigrants to Oregon. One of the highest and grandest mountains in the United States, Mount Shasta, was in the early days of Californian emigration known to the Americans almost exclusively as *Shasta Butte*. Other prominent lofty peaks in California are still called *buttes*, as *Downieville Butte*, *Marysville Butte*, etc. This use of the word *butte*, now gradually disappearing from the region in question, is a relic of French occupancy of the Northwest, and of the subsequent wide distribution through that region of the Hudson's Bay Company's employees, most of whom were of French extraction. The word was picked up by overland emigrants and carried to the furthest West; and it has been much used as a place-name, alone or in combination.

The fatty portion of milk. As prepared for use, it contains 80 to 85 per cent. of fats, with varying amounts of water and salt, and minute quantities of sugar and curd. It is used as a food or relish by most peoples, and is made directly from the milk, or from the cream previously separated from the milk, of cows, goats, and other animals. Agitation or churning separates the fats from the milk or cream and makes them cohere in lumps, which are then worked together, freed as far as possible from buttermilk, and usually mixed with salt, which preserves the butter and develops its flavor.

The following are the most important of them. *Cacao-butter*, or oil of theobroma, is obtained from the seeds of the cacao (*Theobroma cacao*) of tropical America; it is "a yellowish-white solid, having a faint agreeable odor, a bland chocolate-like taste, and a neutral reaction" (*C. S. Dispensatory*, p. 1049). *Caura butter* is obtained from the fruits of *Vateria indica*; it is a resin rather than an oil, and is used as a varnish. *Fulva butter* is from the seeds of the East Indian *Bassia butyracea*; *Kokum butter*, from the seeds of *Garcinia indica*; *Mahwah butter*, from *Bassia latifolia*. *Shea butter*, also called *alunon* or *Bancuk butter*, is from the kernels of the shea-tree, *Butyrospermum Parkii*, of western Africa; it resembles palm-oil, but is of a deeper-red color. MD. botervoghel, a butterfly, = G. buttervogel, a large white moth (MD. voghel, D. vogel = G. vogel = F. fowl).*] The reason for the name is uncertain; it was probably at first applied to the yellow species. Grimm says it has its name, as well as an old German name *molkendieb* (late MHG. *molkendiep*), 'milk-thief,' from the fact that people formerly believed that the butterfly, or elves or witches in its shape, stole milk and butter; but the legend may have arisen out of the name.

Another explanation, based on another name of the butterfly, MD. *boterschijte*, -schiete, -schete, refers it to the color of the excrement (*schijte*.) 1. The common English name of any diurnal lepidopterous insect; especially, one of the rhopaloceros *Lepidoptera*, corresponding to the

The insect is specially interesting from the dissimilarity of the sexes, or sexual dimorphism, and from the curious habit of the larva, which lives in a cup made of the folded leaf. The larva is clear-green in color, with pale-white granulations and interspersed dark indentations. The chrysalis is light-green, banded with dark-gray. The male butterfly is deep coppery-red, marked with dark purplish-brown, while the female is much lighter-colored, though also marked with dark brown. — **Sea-butterfly**, a mollusk of the subclass *Pteropoda*, so called from its extended lateral foot-lobes, which simulate wings.

The name is due to the greasy-looking viscid surface of the leaves, which are covered with soft, pellucid glandular hairs, secreting a glutinous liquor that catches small insects. The edges of the leaf roll over on the insect and retain it, and the insects thus caught are supposed to serve as food for the plant. In the north of Sweden the leaves are employed to curdle milk.

Byzantium was founded by a Greek colony in the seventh century B. C., but was of no great importance until A. D. 330, when the emperor Constantine the Great made it his capital, and changed its name to Constantinople, after himself. — *Byzantine architecture*, a style of architecture developed from the classical under the Byzantine empire during the fourth and fifth centuries A. D., and, under various modifications, used till the final conquest of

that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the incrustation of brick or rough stonework with more precious materials; large spaces are left void of bold architectural features, to be rendered interesting merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives. The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round arched western architecture; and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople, and the church of St. Mark, in Venice, are classical examples of Byzantine architecture. — *Byzantine historians*, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

C. C. Perkins, *Italian Sculpture*, Int., p. i.

1. The third letter and second consonant in the English, as in general in the other alphabets derived from the Phœnician. The value of the sign, however, in Phœnician as in Greek, was that of a hard *g* (in *go, give*); and so also originally in Latin, beside the sign *k*, which had the proper *k*-sound. But the Latins gave up for a time the written distinction of the *k*-sound from the *g*-sound, writing both with the same character, *C*; and when later they readopted the distinction, instead of reducing *C* to its original value, and restoring *k*, they retained the *k*-value for the *c*, and added a tag to the same character for the *g*-sound, thus turning *C* into *G*. The comparative table of forms, like that given for the other letters (compare *A* and *B*), is as follows:

Egyptian Hieroglyphic.	Hieratic.	Phœnician.	Early Greek and Latin.

Great as is the apparent difference between Greek *Γ* and our *C*, it is due only to a shifting of the position of the angle made by the two component lines, and the rounding of this angle. The hard or *k*-sound which belonged to this character in early Latin belonged to it also in Anglo-Saxon (which, like Latin, made little or no use of *k*). But this *k*-sound, as being a guttural or back palatal mute, is particularly likely to be shifted forward along the tongue and to be changed into front-palatal and sibilant sounds, especially before vowels like *e, i, y*, which favor the front-palatal position. Hence it comes that *c*, still so written, is pronounced as *s* in English before *e, i, y*, and elsewhere as *k*. But this "soft" or sibilant *c* belongs to the French part of our language; the Anglo-Saxon *c*, when softened, gets the sound usually represented in English by *ch*, and is so written: for example, in *chicken, choose, church, birch, teach*. (See *ch*, and *assimilation*.) No word containing *c* pronounced *s* is of Anglo-Saxon origin, except a few misspelled, as *cinder* for *sinder*, and *once, twice, etc., pence, miles, etc.*, having *-ce* for original *-es, -s*. (See *-cel*.) For the sounds of *ch*, see *ch*.

2. As a numeral, in the Roman system, *C* stands for 100, and is repeated up to CCCC, 400 (followed by *D*, 500). This symbol, originally , that is, the Greek theta (Θ), was afterward reduced to *C* and understood to stand for *centum*, a hundred.

3. As a symbol: (a) In music: (1) Used in English and German to designate the key-note of the natural scale. See *natural* and *scale*. (2) When placed on the staff immediately after the clef, a sign of common time, each measure containing 4 quarter notes or their equivalent. When a vertical line is drawn through it, it indicates *alla breve* time, each measure containing 2 or 4 half notes, played more quickly than in common time. (3) On the keyboard of the organ or pianoforte, the white key or digital next to the left of each group of two black keys. The middle *C* of the keyboard is a usual starting-point in the reckoning of both keys, tones, and notes; it is also known as *alto C*, or *c'*; the next *C* below is called *tenor C*, or *c*; the second *C* below, *bass c*, or *c*; and the next *C* above, *treble C*, or *c''*, etc. The present pitch of middle *C* is from 250 to 265 vibrations per second; it is often theoretically fixed in Germany at 264, in England at 256, and in France at 251. About 1700 it was actually about 240, and in recent times as high as 275. The major scale of *C*, because it comprises all the white keys and none of the black ones, is taken as the normal or standard scale of the keyboard. (b) In the mnemonic names of moods of syllogism, the symbol of reduction *per impossibile*. (c) In *math.*, *C* is used to denote a constant of integration. See also *A*, 2 (c), (d), (e). (d) In *chem.*, the symbol for *carbon*.

4. As an abbreviation, *c*, or *C*, stands, in dental formulas of zoölogy (*c.*), for *canine tooth*; in United States money (*c.*), for *cent*; in thermometer-readings (*c.*), for *centigrade*; in French money (*c.*), for *centime*; in references (*c.*), for *chapter* (or Latin *capitulum*); in dates, before the number (*c.*), for Latin *circa*, about; in meteorology (*c.*), for *cirrus*; in a ship's log-book (*c.*), for *cloudy*; and in measures of volume (*c.*), for *cubic*.—Middle *C*, in music, the note on the first ledger-line above the bass or below the treble staff. (See *above*.)

It especially resorts to the shores of the Orkney, Shetland, and Faroe islands, Iceland, etc., appearing in herds of from 100 to 1,000 individuals. Bradshaw & Rotch (the latter a member of Parliament) obtained licences for eight cabriolets in 1823, and started them at fares one third lower than those of hackney coaches. The new vehicles were hooded chaises, drawn by one horse, and carrying only one passenger besides the driver, who sat in the cabriolet (or, as more commonly called for brevity, the *cab*) with his fare. . . . The name *cab* is still commonly applied to all hackney carriages drawn by one horse, whether on two or four wheels.

It was equal to 2.021 liters, or 4½ United States pints. Other statements appear to be due to confusion of different measures by Greek metrologists; but a *great cab*, of ¾ the ordinary size, is mentioned in the Talmud.

They besieged it [Samaria] until an ass's head was sold for fourscore pieces of silver, and the fourth part of a *cab* of dove's dung for five pieces of silver.

3. Conjoint intrigue; secret artifices of a few persons united in some design: as, "curs'd cabals of women," *Dryden*.

Centuries glide away in the same unvaried round of cabals at court.

Brougham.

4. A number of persons united in some close design, usually to promote their private views in church or state by intrigue; a junto. The name of "the Cabal" was given to an unpopular ministry of Charles II., consisting of Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names happened to compose the word.

These ministers were therefore emphatically called the *Cabal*; and . . . it has never since their time been used except as a term of reproach. *Macaulay, Hist. Eng., ii.*

=Syn. 4. *Combination, Party, Faction, Cabal, Camarilla, Junta*. *Combination* is the most general of these words, but it expresses least of permanence in organization; it often denotes the union for special ends of individuals or parties otherwise antagonistic: as, the Democrats and Greenbackers entered into a *combination* to secure the election. A *party* is strictly a more close and permanent union of individuals, organized to promote certain principles or common interests which they consider of fundamental importance: as, the Low Church *party*, the Republican *party*; but the term is more loosely used where organization is wanting: as, the Free-trade *party*. *Combination* and *party* may express that which is entirely reputable; the other words are chiefly unfavorable in their signification. A *faction* is commonly a section of a party; it is generally a comparatively small number of individuals, whose principles and objects are often of a capitious, frivolous, or selfish nature, but advocated so persistently as to be annoying, and with so little regard to the general interest as sometimes to be dangerous. *Cabal* and *junto* express a union less comprehensive than *party* or even *faction*; the intrigues of a *cabal* or *junto* are usually conducted mainly for the personal aggrandizement of its members. *Junto* has almost entirely given place to *cabal* in modern use. A *camarilla* is a more or less united body of secret counselors of a ruler, acting generally in opposition to his official advisers, and constituting a "power behind the throne."

After numerous abortive attempts and unsuccessful combinations in which Newcastle bore the chief part, it became evident . . . that the union . . . of Newcastle . . . and Pitt was absolutely necessary.

Lecky, *Eng. in 18th Cent., viii.*

If I could not go to heaven but with a *party*, I would not go there at all. Therefore I protest to you I am not of the *party* of federalists.

Jefferson, *Correspondence, II. 439.*

By a *faction*, I understand a number of citizens, whether amounting to a majority or minority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community.

Madison, *Federalist, No. 10.*

In a simple monarchy, the ministers of state can never know their friends from their enemies; secret cabals undermine their influence and blast their reputation.

Sw. *kabbala*), a transcription of Heb. *qabbäläh*, reception, the cabala or mysterious doctrine received traditionally, < *qabal*, receive, take, in the Piel conjugation *qibbël*, receive (a doctrine). Hence *cabal*¹.] 1. The theosophy or mystic philosophy of the Hebrew religion, which grew up mainly after the beginning of the tenth century, and flourished for many generations. The cabala employed itself first in a mystic explanation of deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves a kind of secret interpretation.

One versed in or engaged in the study of the cabala or mystic philosophy of the Jews. The magical doctrines of the cabalists embrace the nature of the supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity, so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

The *Cabalists* had a notion, that whoever found out the mystic word for anything attained to absolute mastery over that thing. *Lowell*, *Among my Books*, 1st ser., p. 158.

Every cabinet includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, and the five Secretaries of State, with two or more other members, at the prime minister's discretion. In the United States the *cabinet* is a collective popular name, not recognized by law, for the heads of the eight executive departments, namely, the Secretaries of State, the Treasury,

War, the Navy, the Interior, and Agriculture, the Postmaster General, and the Attorney General. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation. The term *cabinet* is also sometimes applied to the executive council of a governor or of a mayor.

The insulating layers are generally separated from the outer wires by a padding of putty or hemp saturated with tar or other protective substance. The cacao is a small evergreen tree, from 16 to 40 feet high when growing wild, a native of tropical America, and much cultivated there and to some extent in Asia and Africa. Its fruit is a some- what pear-shaped pointed pod, 10-furrowed, from 5 to 10 inches long, and contains numerous large seeds embedded in a sweet pulp. These seeds are very nutritive, contain- ing 50 per cent. of fat, are of an agreeable flavor, and are used, both in their fresh state and when dried, as an article of food. The seeds when roasted and divested of their husks and crushed are known as *cocoa-nibs*. These are ground into an oily paste, and mixed with sugar and flavoring matters, to make chocolate, the most important product of the cacao. (See *chocolate*.) Cocoa consists of the nibs alone, either unground or ground, dried, and powdered, or of the crude paste dried in flakes. Broma consists of the dry powder of the seeds after a thorough expression of the oil. A decoction is also made from the husks alone, under the name of *cocoa shells*. These sub- stances, containing the alkaloid theobromine, analogous

to thein and caffeine, are very extensively used as substi- tutes for tea and coffee. The oil from the seeds, called *cacao butter*, is solid at ordinary temperatures, and has a pleasant color and choco- late-like taste. It is used for suppo- sitories, and for making soap, po- matums, etc.

cadmium (kad'mi-um), *n.* [NL., < *L. cadmia*: see *cadmia*.] Atomic weight, 112.1; chemical symbol, Cd. A metal discovered by Stromeyer in 1817, resembling tin in color and general appearance, and, like that metal, having a "cry" when bent. The specific gravity of the cast metal is 8.62; of the rolled, 8.69. Its hardness is between that of gold and tin, and it is easily rolled to sheets or even to very thin foil. It fuses at about the same temperature as tin, 467° F., and communicates to various alloys the property of fusing at very low temperatures. (See *Wood's metal*, under *metal*.) If 8 to 10 per cent. of cadmium be added to Rose's metal, its fusing-point is lowered to 167°. Cadmium is a common accompaniment of zinc ores, both blende and calamin, and it is in the smelting of these

that the commercial metal is obtained, which is done almost exclusively in Silesia and Belgium. Some kinds of blende contain as much as 3 or 4 per cent. of sulphid of cadmium. This metal also occurs by itself naturally in combination with sulphur, forming the rare mineral called *greenockite* (which see). The manufactured sulphuret is of importance as furnishing a brilliant and permanent yellow color called *cadmium yellow* (see below). This is used by artists, also in coloring soap, and to some extent in calico-printing. It is also used for giving a yellow luster to the surface of porcelain. The total produce of cadmium is supposed to be about two tons a year. **Cadmium blende**, the mineral *greenockite*.

It was originally merely the Greek herald's staff, a plain rod entwined with fillets of wool. Later the fillets were changed to serpents; and in the conventional representations familiar at the present day the caduceus is often winged. The caduceus is a symbol of peace and prosperity, and in modern times figures as a symbol of commerce, Mercury being the god of commerce. The rod represents power; the serpents represent wisdom; and the two wings, diligence and activity. In heraldry it is blazoned as a staff having two serpents annulated about it, mutually respectful, and joined at the tails: it is a rare bearing.

Ca luecus.

(See *floating dock*, under *dock*.) (c) A water-tight box or casing used in founding and building structures in water too deep for a coffer-dam, such as piers of bridges, quays, etc.

The caisson is built upon land, and then chained and anchored directly over the bed, which has been leveled or piled to receive it. The masonry is built upon the bottom of the caisson, which is of heavy timber. As the caisson sinks with the weight, its sides are built up, so that the upper edge is always above water. In some cases the masonry is at first built hollow, and is not filled in until after it has reached its bed, and its sides have been carried higher than the surface of the water. Sometimes the sides of the masonry itself form the sides of the caisson. In another form the caisson, made of heavy timbers, is shaped like an inverted shallow box, having sharp, iron bound edges. The weight of the masonry forces the caisson into the sand and mud on the bottom. Air under pressure is then forced into the caisson.

driving out the water and permitting the workmen to enter through suitable air-locks. A sealed well or a pipe and sand-pump are provided, through which the material excavated under the caisson may be removed. The latter gradually sinks under the weight of the superstructure and the removal of the loose soil below, until a firm foundation is reached, when the whole interior of it is filled with concrete. The caissons beneath the towers of the East River suspension-bridge, connecting New York and Brooklyn, are of this description. The *pneumatic caisson* is an inverted air-tight box, into which air is forced under a pressure sufficient to expel the water, thus leaving a space in which men can work to loosen the soil as the caisson descends. The principle of the pneumatic caisson is applied to the sinking of large iron cylinders to serve as piers or land shafts. Sometimes written *caisson*.

calcium (kal'si-um), *n.* [NL., < *L. calx* (calc-), lime: see *calx*¹ and *chalk*.] 1. Chemical symbol, Ca; atomic weight, 40. A metal having a light-yellow color and brilliant luster, about as hard as gold, very ductile, and having a specific gravity of about 1.57. It oxidizes readily in moist air, and at a red heat burns vividly, forming calcium oxid, CaO, or quicklime, one of the alkaline earths. On adding water this forms calcium hydrate, Ca(OH)₂, or slaked lime. Calcium is not found native in the metallic state, but it unites with most of the non-metallic elements in compounds which are widely distributed in nature and extensively used. The mineral calcite, all limestone or marble, and the chalk deposits are calcium carbonate; gypsum is calcium sulphate; and calcium also enters into the composition of nearly all the native silicates.

of gas, one of oxygen and the other of hydrogen, in a state of ignition, upon a ball of lime. Captain Drummond, the inventor, proposed the use of this light in lighthouses. Another light, previously invented by him (1825), was employed in geodetical surveys when it was required to observe the angles subtended between distant stations at night. The light was produced by placing a ball of dish of lime in the focus of a parabolic mirror at the station to be rendered visible, and directing upon it, through a flame arising from alcohol, a stream of oxygen gas. Also called *Drummond light*, *oxyacetylene light*, *limeball-light*, and *lime-light*.

But mathematicians make the opposite distinction; in their language, to *compute* means to make elaborate calculations with the art of a person trained to this business. *Reckon* is essentially the same as *compute*, but may be simpler yet: as, to *reckon* interest, or the amount of a bill, or the days to a coming event. To *count* is to reckon one by one. The figurative uses of these words are not suggested by any comparison of their literal meanings; in them all some mental estimate may be supposed to be made, akin to an arithmetical process. "I *reckon* that the sufferings of this present time are not worthy to be compared with the glory which shall be revealed in us." *Rom. viii. 18*. The use of *calculate* for *reckon* in such a case as this is an Americanism. "I *count* not myself to have apprehended." *Phil. iii. 13*. *Reckon* may be used in such a connection, but not the other two words.

When they come to model heaven And *calculate* the stars. *Milton, P. L.*, viii. 80.

After its own law and not by arithmetic is the rate of its [the soul's] progress to be *computed*. *Emerson, Essays*, 1st ser., p. 249.

calculating-machine (kal'kü-lä-ting-mä-shên'), *n.* Any machine which performs numerical calculations. The principal kinds are: (a) Multiplying and dividing machines. (b) Difference-engines, which calculate and print tables from the initial values of the tabular number and its first, second, etc., differences. The first of these was that of Babbage, of which the Scheutz machine, now at the Albany observatory, is a modification. (c) The analytical engine of Babbage, which was designed to calculate and print tables of a function from constants, but was never actually constructed. (d) Tide-predicting machines, of which several have been constructed, with one of which, that of Ferrel, the regular tide-tables published by the United States Coast Survey are now computed. (e) Machines for integrating differential equations, though these are rather instruments than machines. (f) Logical machines, for deducing conclusions from premises. There are also important instruments for performing calculations, which are not usually called machines. Such are the abacus, the celestial globe, and Hill's machine for predicting eclipses and occultations, used in the calculation of the American ephemeris. (See *cut* under *abacus*.) There are also various calculating-scales, such as Napier's bones. Many of these devices are of considerable utility, such as Airy's stick for gaging cylindrical vessels, and the gagers' rod. Some instruments perform calculations subsidiary to the process of measurement, as the *planimeter*.

calculation (kal'kü-lä'shon), *n.* [*< ME. calculacion*, -tion, < *L. calculatio*(n-), < *calculari*, reckon: see *calculate*, *v.*] 1. The act of calculating; the art, practice, or manner of computing by numbers; reckoning; computation: as, to find a result by *calculation*; the *calculation* was a difficult one.

2. A system of reckoning time, especially the method of fixing the length and divisions of the year.—3. A table or tables of the days of each month in a year, with their numbers, for use in fixing dates.—4. A table or catalogue of persons, events, etc., made out in order of time, as a list of saints with the dates of their festivals, or of the causes to be tried in a court; specifically, in British universities, a chronological statement of the exercises, lectures, examinations, etc., of a year or of a course of study.

6. A series of emblematic pictures of the months: a common motive of decoration during the middle ages, in sculpture, painted glass, earthenware tiles, and the like.

For each month the zodiacal sign is represented, with one or more persons engaged in labors or sports characteristic of the month.—*Calendar*—*amendment Act*, an English statute of 1751, which took effect in 1752, establishing January 1st as the beginning of each year (instead of Lady-day, March 25th), adopting the Gregorian or "new style" in place of the Julian or "old style" calendar, and canceling the then existing excess of 11 days by making the 3d of September, 1752, the 14th. Also known as *Lord Chesterfield's Act*.

—*Calendar month*, a solar month as it stands in almanacs.—*Calendar moon*. Same as *ecclesiastical moon* (which see, under *ecclesiastical*).—*Ecclesiastical calendar*, an arrangement of the civil year employed by the liturgical churches to designate the days set apart for particular religious celebration. As many feasts of the church depend upon Easter, the date of which varies from year to year, either the calendar must vary every year or must contain simply the matter from which a true calendar can be computed for each year. In the Roman (Catholic) Church, special circumstances in the history of each nation affect its liturgical calendar; hence every nation, and to some extent every religious order and even every ecclesiastical province, has its own calendar. The German Lutheran Church retained at the Reformation the Roman Catholic calendar, with the saints' days then observed. The Church of England still retains in its calendar certain festivals, called black-letter days, for which no service is prescribed, and which have been omitted by the Protestant Episcopal Church of America. See *Easter*.—*Gregorian calendar*, the reformed Julian calendar introduced by the bull of Pope Gregory XIII. in February, 1582, and adopted in England in September, 1752; the "new style" of distributing and naming time. The length of the year of the Gregorian calendar is regulated by the Gregorian rule of intercalation, which is that every year whose number in the common reckoning since Christ is not divisible by 4, as well as every year whose number is divisible by 100 but not by 400, shall have 365 days, and that all other years, namely, those whose numbers are divisible by 400, and those divisible by 4 and not by 100, shall have 366 days. The Gregorian year, or the mean length of the years of the Gregorian calendar, is 365 days, 5 hours, 49 minutes, and 12 seconds, and is too long by 26 seconds. The Gregorian rule has sometimes been stated as if the year 400 and its multiples were to be common years; this, however, is not the rule enunciated by Gregory. The Gregorian calendar also regulates the time of Easter, upon which that of the other movable feasts of the church depend; and this it does by establishing a fictitious moon, which is purposely made to depart from the place of the true moon in order to prevent the coincidence of the Christian Paschal feast with that of the Jews.—*Hebrew calendar*, the luni-solar calendar used by the Jews since the second century of the Christian era. The years, numbered from the creation, are either ordinary, containing 12 lunar months and 353, 354, or 355 days, or embolismic, containing 13 lunar months and 383, 384, or 385 days. In every cycle of 19 years 7 are embolismic, to bring lunar and solar time into agreement. To find the number of the Hebrew year beginning in the course of a given Gregorian year, add 3761 to the number of the latter.—*Julian calendar*, the solar calendar as adjusted by Julius Cæsar, in which the chronological reckoning was first made definite and invariable, and the average length of the year fixed at 365½ days. This average year (called the *Julian year*) being too long by a few minutes, the error was rectified in

Part of a Calendar of the 13th century. July.—From portal of Amiens Cathedral.

the Gregorian calendar. The Julian calendar, or "old style," is still retained in Russia and Greece, whose dates consequently are now 12 days in arrear of those of other Christian countries.—*Mohammedan calendar*, the lunar calendar employed in all Mohammedan countries, though there is another peculiar to Persia. The years consist of 354 or 355 days, in the mean 354½. The beginning of the year thus retrogrades through different seasons, completing their circuit in about 33 years. They are numbered from the hejra (which see), the first day of the first year being July 16th, A. D. 622. The 1300th year began Sunday, November 12th, 1882.—*Republican calendar*, the calendar of the first French republic. The year consisted of 365 days, to which a 366th was to be added "according as the position of the equinox requires it," so that the year should always begin at the midnight of the Paris observatory preceding the true autumnal equinox. The numbers of the years were written in Roman numerals. The year I. began September 23d, 1792, but the calendar was not introduced until October 5th, 1793. Every period of four years was called a *franchise*. The years of 366 days were called *sextile*. There were 12 months of 30 days each, and 5 or 6 extra days at the end called *sansculottides*. The names of the months, beginning at the autumnal equinox, were Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Fructidor, Messidor, Thermidor, and Fructidor.

*calender*¹ (kal'en-dēr), *n.* [*F. calandre*, *< ML. celendra*, a calender, a corruption of *L. cylindrus*, a roller, cylinder; see *cylinder*.] 1. A machine consisting of two or more cylinders or rolls revolving very nearly in contact, between which are passed woven fabrics, paper, etc., for preparation or finishing by means of great pressure, often aided by heat communicated from the interior of the cylinders. The object of the calender for cloth and paper is to give the material a perfectly smooth and equal surface, and sometimes to produce a superficial gloss, as in certain cotton and linen fabrics and what is specifically called *calendered paper*, or a waxy sheen, as in watered silk, etc. The larger rolls in such a calender are usually made of solidified paper or pasteboard turned exactly true, with intermediate cast-iron cylinders. Calenders are attached to paper-making machines for expressing the water from the felted web of paper, and for the finishing processes of smoothing and glazing. They are also used for spreading india-rubber into sheets suitable for making rubber fabrics, etc. 2. An establishment in which woven fabrics are prepared for market by the use of the calender and the other necessary processes.

*Calender*³, *Kalender* (kal'en-dēr), *n.* [= *F. calender*, *< Ar. qalandar*, *> Turk. qalander*, Hind. *qalander*.] One of an order of dervishes founded in the fourteenth century by an Andalusian Arab named Yusuf, who was expelled from the order of Bektashis on account of his extreme arrogance. The Calenders are wanderers who preach in the market-places and live by alms. Though the title *Calender* asserts for its bearers a life of great purity, the members of this order, even before the death of its founder, fell into the grossest licentiousness and debauchery, and have not hesitated at assassination. They hold that salvation is as little affected by vice and crime as by virtue and holiness, and that sin stains the body only and can be removed by ablutions.

On the road I caused my beard and eyebrows to be shaven, and assumed a *calender's* habit.

The reason of the name is uncertain.] 1. In the Roman calendar, the first day of the month. From this the days of the preceding month were counted backward to the ides, which in March, May, July, and October corresponded to the 15th, and in all the other months to the 13th day of the month. Thus the 16th day of March by our reckoning was in the Roman calendar the 17th day before the calends of April (the first of April being included), or more briefly 17th calends; the 14th day of January was the 19th day before the calends of February; the 14th day of any month with thirty days being the 15th before the calends of the succeeding month.

1. The diameter of a body, especially of the hollow inside of a cylinder: as, the *caliber* of a piece of ordnance or other firearm. In the United States the caliber of a firearm is expressed in decimal parts of an inch, thus, a rifle of .44-inch caliber (often shortened to ".44 caliber rifle," and a .22 caliber pistol, etc.); or, in Great Britain, the caliber of a gun, or of the weight of a solid round shot which it can carry, as a 12 pounder. In Great Britain the calibers of small arms are commonly expressed in decimal parts of an inch, of half-guns, by the weight of a solid round shot which will fit the bore, as a 6 pounder; of heavy guns, in tons, as a 38-ton gun or a 100-ton gun. In France and in other countries on the continent the caliber is expressed in millimeters or centimeters.

The patterns are engraved upon the surface of copper rollers, and the movement of the cloth is continuous and rapid. The colors used are either substantive or adhesive: the former have an affinity for the cloth, and by themselves adhere and form permanent dyes; the latter will not of themselves adhere to the fibers, or, if they do, are not permanent, but require to be fixed by mordants.

The various styles of printing are called the *bandana*, *china blue*, *decoloring*, *discharge*, *madder*, *padding*, *resist* style, etc.

In the ice-calorimeter the substance to be operated on is inclosed in a cavity of ice, and the quantity of heat is determined by observing the increase of volume due to the melting of a portion of the ice. In other forms the rise in temperature of a known quantity of some liquid, as water or mercury, or the amount of expansion caused in a known volume of mercury, is noted.

Here's deflagrator was an early form.

calory (kal-ō-ri), *n.* [*F. calorie*, < *L. calor*, heat.] In *phys.*, the quantity of heat necessary to raise the temperature of a kilogram of water from 0° to 1° centigrade. It is the unit of heat ordinarily employed in calorimetry by modern physicists, instead of the thermal unit based on the English measures. (See *thermal*.) The small calory or thermal unit on the C. G. S. system is the heat required to raise the temperature of one gram of water from 0° to 1° C. Although this particular degree of the scale is always specified in formal

definitions, yet it is practically assumed that the specific heat of water is constant, so that if the calory were defined in terms of the degree from 20° to 21°, it would more accurately represent the meaning in use. Also spelled *calorie*.

The *Caloric* is equal to 41,536,010,000 ergs or 423.985 kilocalorie-metres. A. Daniell, *Prin. of Physics*, p. 317.

Rummaging Ground-beetle—*Calosoma scutellaria*, with larva of *C. calidum*. Natural size.

C. scutellaria, and *C. calidum* are other species of this widely distributed genus, commonly called ground-beetles. Also spelled *Calissoma*.

It contains both winged sexual individuals and apterous, fully developed, but sexually aborted individuals. *C. flavicollis* of southern Europe is an example.

The nests of species of *Calotermes* are the most incomplete; they only gnaw passages in wood, which mainly run in the direction of the axis of the tree. There is no special place for the queen. Claus, *Zool. (trans.)*, p. 560.

The bark, which is known as *mudar* and *gerania* (names also given to the plants themselves), is a medicine famous among Oriental physicians. It is employed in many diseases, especially in dysentery, as an alterative tonic and diaphoretic, and as a substitute for ipecac. *C. procera* ranges from India to the Cape Verd islands, and *C. gigantea* from India to Borneo and China. The silky fiber of the latter is finer in quality, and is used for the robes of the native princes, for bowstrings, and for fishing-lines and nets, as it is almost indestructible in water. The wood of both species is made into charcoal for gunpowder, the acrid milky juice mixed with salt is used to remove hair from hides, and the hairs of the seeds are employed for stuffing mattresses.

calotype (kal-ō-tip), *n.* [*Gr. κάλος*, beautiful, + *τύπος*, impression, type.] A photographic process devised by Fox Talbot about 1840, but not now in use. In this process a reflected image is impressed on sensitized paper by exposure in a camera, developed by gallionitrate of silver, and fixed by hyposulphite of soda. The paper used is prepared by being

saturated with iodide of potassium and then washed with nitrate of silver, thus forming an iodide of silver, which is rendered very sensitive to light by a wash of gallic acid and nitrate of silver.

Calvinism (kal-'vin-izm), *n.* [= *F. Calvinisme*, < *Calvin*, equiv. to *F. Chauvin* (see *chauvinism*) and derived from *L. Calvus*, a Roman cognomen, lit. 'bald'; < *calvus*, bald: see *callow*!]. The theological tenets or doctrines of John Calvin, a French Protestant theologian (1509-64). The peculiar characteristics of his system, as derived from

his "Institutes," are his doctrines of original sin, namely, that we derive from Adam "not only the punishment, but also the pollution to which the punishment is justly due"; of freedom of the will, namely, that man "in his present state is despoiled of freedom of will and subject to a miserable slavery"; of grace, or that "the Lord both begins and completes the good work in us," and gives us "both will and power"; of predestination, or "the eternal decree of God, by which he has determined in himself what he would have become of every individual of mankind"; and of perseverance, or the doctrine that all the elect will certainly be saved. Calvinism has, however, been materially modified since Calvin's day, and the name is applied to modern systems of theology which differ more or less widely from his system in each of these particulars. (See *Calvinist*.) Generally, Calvinism may be said to rest upon the absolute sovereignty of God over all his creatures. It is in a modified form the theological system of most Baptists, Presbyterians, and Congregationalists.

If Arminianism most commends itself to our feelings, Calvinism is nearer to the facts, however harsh and forbidding these facts may seem.

Frontis, Short Studies on Great Subjects, II. 12.

Calvinist (kal'-vin-ist), *n.* [= *F. Calviniste*: see *Calvinism*.] Primarily, an adherent of the theological system of John Calvin. See *Calvinism*. The name is also given to theologians who hold the doctrine of the Divine Sovereignty as the central truth of their system, but depart more or less widely from the conclusions of Calvin, particularly as regards unconditional election and reprobation and free will. *Strict Calvinists* hold substantially the original views of Calvin; *hyper-Calvinists* add some corollaries which he denied, including a denial of all validity to the use of human means; *moderate Calvinists* modify his views, and hold that man possesses free will notwithstanding the fall, and that his responsibility is limited to his voluntary acts. American Congregationalists and the so-called New School Presbyterians are generally moderate Calvinists.

In bot., in general, the outer set of the envelopes which form the perianth of a flower. It is usually more herbaceous and leaf-like than the corolla, but it is often highly colored and corolla-like, and is sometimes

first to fall. It may form the entire perianth, no corolla being present, or when there are several whorls of en- velops they may so grade into each other that the calyx can not be strictly separated from the bracts without the petals within. The parts of a calyx when distinct are called sepals, and it is discoidal, trisepalous, etc., ac- cording to their number. When they are more or less co-

alescent into a cup or tube, it is said to be gamosepalous or monosepalous, and may be regular or irregular, or variously toothed, cleft, or divided, and either free from the ovary or adnate to it.

2. In human anat., one of the cup-like or infundibuliform beginnings of the urter in the pelvis of the kidney, surrounding the apices of the Malpighian pyramids, each receiving usually more than one pyramid. There are from seven to thirteen such calyces, converging and uniting in three infundibula, which in turn combine to form the pelvis. [In this sense *calyx* is generally found in the plural form, *calyces* or (incorrectly) *calices*.]

(c) In erinoids, the cup at the summit of the stalk or stem, whence the brachia radiate and on the surface of which is the mouth. The base of the calyx is the summit of the stem, which may be a modified joint or ossicle composed of confluent joints. See cut under *Erinoida*. cam (kam), *n.* [A dial. form of *comb*, < ME. *canb*, < AS. *camb* = D. *kam* = G. *kamm* = Dan. *Sw. kam*, etc., a comb; also applied to several mechanical devices, as D. *kam*, a bridge, sley, = G. *kamm*, a cog (kamm-rad, a cog-wheel), = Dan. *kam*, a cog, bit, ridge (kam-hjul, a cog-wheel); see *comb*.] 1. A comb. [Prov. Eng.] —2. A ridge, hedge, or long earthen mound. [North. Eng.]—3. In mach., a device for converting a regular rotary motion into an irreg- ular, fast and slow, intermittent rota- ry or reciprocating motion. It properly includes the cam-wheel, plain or geared, the cam-shaft, the heart-wheel, the wiper, the wiper-wheel, and the eccentric. The simplest form is that of a heart-shaped, lobed-shaped, or other- wise eccentric wheel, which imparts motion to another wheel either by means of gearing or by rolling contact. In- stead of following the irregular face of the cam wheel, the friction-wheel may travel in a curved race or guiding path on the side of a cam disk, as in the cam-wheel of a harvester. In another form the face of the wheel is cut into gears or into projecting teeth that may engage another gear, or an arm or a pinion upon a shaft, to give a quickly changing rising and falling motion. Such cams are also called *wiper-wheels*, and are used to operate stamps and tilt-hammers. The heart-wheel accom- plishes the same object, but in a less abrupt manner, while eccentric cams of various shapes may impart a slow thrust and quick return, as in many machine tools. The wiper, a cam-shaped arm, is very generally used to operate the valves of beam-engines. The cam in some of its forms ap- pears in a great variety of machines, wherever an irreg- ular speed or motion or a rapid reciprocating motion is required, as in the harvester, printing press, sewing-machine, etc. A cam shaft is a shaft having tumbler or wipers. The heart wheel is a heart-shaped cam. (See *eccentric*.) Cams for determining motion for cutting and tracing, as in certain machines, are called *shape-cams*. —Solid cam, a form of cam employed when the series of changes in velocity and direction required are too numer- ous to be included in a single rotation of a cam-plate. The cam is formed on the surface of a cone, either parallel to the axis or spirally, and the cone as it revolves is made to travel also in the direction of its axis by means of a screw.

cambium² (kam'bi-um), *n.* [NL., a particular application of ML. *cambium*, exchange: see *cambium1*.] 1. In bot., a layer of tissue formed between the wood and the bark of exogenous plants. It was believed by the older botanists to be a mucilaginous fluid exuded between the wood and the bark, and organized into new wood and new bark. It is now known to be not a fluid, but a layer of extremely delicate thin-walled cells, filled with protoplasm and organizable nutrient matter, and appearing like a thin film of mucus. These cells develop on the one side into a layer of new wood, and on the other of new bark, while at the same time fresh cambium is formed for the continuation of the work. It is by the renewal of this process year after year that the increase of growth in the stem is effected, as indicated by its concentric rings. In the primary fibrovascular bundles of the stem a similar layer of cambium, with the same function, is always found between the woody and corky portions.

A large ruminant quadruped of the family *Camelidae*, genus *Camelus*, used in Asia and Africa as a beast of burden. There are two distinct species of camels: (1) The Arabian camel, *C. dromedarius*, with one hump, and four callousities on the fore legs, and two on the hind legs. It is a native of Arabia and is now known only in the domesticated state; it is used chiefly in Arabia and Egypt. There are several breeds of Arabian varieties. The dromedary is one of those, being simply a "blooded" or thoroughbred camel of great speed and bottom, used as a saddle animal, and comparing with the heavier and slower varieties as a race horse does with a cart horse; it is not a different animal zoologically speaking. (2) The Bactrian camel, *C. bactrianus*, with two humps, of which there are also dif-

ferent breeds. The name *camel* is sometimes applied to the species of the American genus *Lama*, as the llama, alpaca, and vicuña, collectively known as the camels of the new world. The Arabian camel is poetically called the ship of the desert. Camels constitute the riches of an Arabian; without them he could not subsist, carry on trade, or travel over sandy deserts. Their milk and flesh are used for food and their hides for leather, and their hair is a valuable article of trade and manufacture. By the camel's power of sustaining abstinence from drink for many days, due to the reserve it can carry in its peculiarly constructed cellular stomach, and of subsisting on a few coarse, dry, prickly plants, it is especially fitted for the parched and barren lands of Asia and Africa. Camels carry from 600 to 1,000 pounds burden.

2. A water-tight structure placed beneath a ship or vessel to raise it in the water, in order to assist its passage over a shoal or bar, or to enable it to be navigated in shallow water. It is just filled with water and sunk alongside the vessel, to which it is then secured. As the water is pumped out, the camel gradually rises, lifting the vessel with it. Camels have also been used for raising sunken vessels. **Camel's hair**, the hair of the camel, from which very fine fabrics, especially shawls, are made in the East, and also carpets, tent-cloths, etc. In Europe it is used chiefly for mixing with silk. The best comes from Persia. The so-called camel's-hair pencils or brushes used in painting are not made of camel's hair, but commonly of hair from the tails of Russian and Siberian squirrels. See *brush*.—**Camel's-hair cloth**. (a) An Oriental fabric. See *putto*. (b) A French imitation of this fabric; a warm and light woolen cloth with a gloss, but having long hairs standing up upon it. *Dict. of Needlework*.—**Camel's-hair shawl**, a name often given in the United States to the cashmere shawl.—**Camel's hay**. An engraving in relief upon a gem, a hard stone of moderate size, or a similar material, or the object itself so engraved, as distinguished from an *intaglio*; specifically, such an engraving upon a stone or a shell having two or three layers differing in color, such as an onyx, agate, etc., and so treated as to utilize the effect of the variety of coloring. Cameos on stone are called *stone cameos*, in contradistinction to the *shell cameos*, or those cut on shells which have superposed layers varying in color, such as the *Cassius rufa*, which gives red on sardonyx, the *Cassius madagascariensis*, white on dark claret, the *Cassius cornuta*, white on orange, the *Strombus* species, white on pink, and other tropical shells. Cameos in distinct bands of colors have been produced since about 1500 B.C.; and some of the ancient examples, as the *Sainte Chapelle* agate, in Paris (13 by 11 inches), representing the apotheosis of Augustus, and the *Vienna onyx* (9 by 8 inches), representing allegorically the coronation of Augustus, surpass in size and in delicacy of execution the best modern specimens.

It is made usually in the form of a box in two parts, connected by an extensible bellows like arrangement serving to adjust the focus, and having one or more lenses fixed in the front. Photographic cameras are made in a great variety of shapes and sizes, according to use, as the *poche camera*, *equipped camera*, *landscape camera*, and *portable camera*, and many different forms of lenses, some of highly specialized types, are used. Provision is made for inserting in the back of the camera carriers or plate holders containing the dry or wet sensitive plates or the paper films, etc., on which the photographs are taken. See *camera obscura*, below, and *photography*.

4. In *anat.*: (a) The so-called fifth ventricle of the brain, between the lamina of the septum lucidum. It consists of a solid prismatic piece of glass mounted upon a brass frame. The prism has its angles so arranged that the rays from the object appear reflected as shown below, and is covered at the top by a metallic eyepiece, the hole in which lies half over the edge of the prism, so as to afford a person looking through it a view of the picture reflected through the glass, and a direct view of his pencil or tra-

cing-point. In the figure the object to be traced, *f*, is opposite the perpendicular surface of the prism, *d, c*, and the rays proceeding from *f* pass through this surface and fall on the inclined plane *b, c*, which makes an angle with *d, c* of $67\frac{1}{2}^\circ$; from this they are totally reflected to the plane *b, a*, which makes an angle of 135° with *b, c*, and are again reflected to the eye at *e* above the horizontal plane, which makes an angle of $67\frac{1}{2}^\circ$ with the plane *b, a*. The rays of light from the object proceeding upward from *h* toward the eye of the observer, he sees the image at *m*, and by placing the paper below in this place the image may be traced with a pencil. The brass frame of the prism has usually two lenses, one concave and the other convex, the former to be used in front between *f* and *d, c* for near-sighted persons, and the latter at *e* for those who are far-sighted. The size of the picture may also be increased or diminished by lengthening or shortening brass tubes connected with the frame. This instrument has undergone various modifications. It is extremely convenient on account of its portability.—**Camera obscura** (Latin, dark chamber), an apparatus in which the images of external objects, received through a convex lens, are exhibited distinctly and in their natural colors on a white surface placed at the focus of the lens. The simplest form of this instrument consists of a darkened chamber, into which no light is permitted to enter except by a small hole in the window-shutter. An image of the objects opposite the hole will then appear on the wall, or on a white screen so placed as to receive the light coming from the opening. A convex lens may be fixed in the hole of the shutter. Portable cameras are constructed of various forms, but the design of them all is to throw the images of external objects, as persons, houses, trees, landscapes, etc., upon a plane or curved surface, for the purpose of drawing, the making of photographic pictures, or mere amusement. The surface on which the image is thrown may be covered with a sheet of paper, on which the figure may be traced by hand with a pencil; but the picture is most distinctly seen when the image is formed on the back of a silvered mirror. The figure represents

by a lens on the roof. By turning the lens around a panorama of the neighboring scenery is exhibited on the table. Cameras for use in sketching are made in the shape of a cone, with a lens and a reflecting mirror at the apex and a drawing-table inside. One side of the box is cut out, and at this opening the artist sits, partly enveloped by a dark curtain which serves to shut out extraneous light. See *optograph*.

Such stands vary in height from those of only a few inches, and intended to rest upon a table or shelf, to those of 4 feet or more, which raised the lamps to a height sufficient to illuminate an apartment. In general, such candelabra consist of a long shaft or rod rising from a base with three feet, and supporting a circular cap or disk with elaborate ornamentation. Some examples are of enormous size and weight, covering at the base a triangle of 6 or 7 feet on each side, and ris-

3. Free from undue bias; fair; just; impartial: of persons or their acts: as, a *candid* view or construction.

Candid and dispassionate men. *Irving*.

= *Syn.* 2 and 3. *Candid*, *Fair*, *Open*, *Frank*, *Ingenuous*, *Native*, *Sincere*, unprejudiced, unbiased. The first seven words apply to the spirit, expression, or manner. The *candid* man is able to look impartially on both sides of a subject especially giving due weight to arguments of opinions opposed to his own, and due credit to the motives of opponents; *candid* speech is essentially the same as *frank* speech, sometimes going so far as to be blunt. *Fair* belongs primarily to conduct, but in regard to speech and thought it is the same as *candid*: as, a man prominently *fair* in dealing with opposing views. *Open* is opposed to concealment; the *open* man does not cultivate a polite reserve, but expresses his opinions freely, without stopping to think of their effect upon his own interests. *Frank*, literally, *free*; the freedom may be one's own opinions, which is the same as *openness*, or in regard to things belonging to others, where the freedom may go so far as to be unpleasant, or as to be disrespectful. Hence, while *openness* is consistent with timidity, *frankness* implies some degree of boldness. *Ingenuous* implies a permanent moral quality, an elevated inability to be other than honest or open, even to one's own loss; there is a peculiar subjective cast to the word, as though the man stood most in awe of the disapprobation of his own judgment and conscience, hence the close connection between *ingenuousness* and *modesty*. *Native* expresses a real or an assumed unconsciousness of the way in which one's words meet conventional rules, or of the construction which may be put upon them by others; *unaffected* is thus an openness or frankness proceeding from native or assumed simplicity or artlessness. *Sincere* expresses the spirit and language that go with the love of truth; the *sincere* man is necessarily *candid* and *frank*, and as open and *frank* as seems required by truth.

He (Dryden) was, moreover, a man of singularly *open* soul, and of a temper so candid enough to be *candid* even with himself. *Lowell, Among my Books*, 1st ser., p. 7.

States from Maine to Texas. The eggs are deposited upon trees. The larvæ, after feeding upon the foliage for about a month, sometimes entirely destroying it, descend by threads to the ground, in which they burrow and undergo transformation, the moths issuing in April, or sometimes in March. The male is winged, but the female is wingless, and is obliged to climb up the tree-trunk in order to deposit her eggs. Hence, an obstructive bandage, oil-tough, or tarred band placed about trees is a common mode of protecting them. The fall canker-worm, *Acanthopoda pomonaria*, is more distinctively a northern species. The moths issue mainly in the fall, and the eggs are exposed. See *geometrid*, *measurer*, and *span-worm*.

An engine, supported on a stationary or movable frame called a *gun-carriage*, for throwing balls and other missiles by the force of gunpowder; a big gun; a piece of ordnance. Cannons are made of iron, brass, bronze, or steel, and of different sizes, carrying balls from 3 or 4 pounds weight up to 2,000 pounds and more. The caliber or power of cannon may be expressed (1) by the

weight of the shot fired: as, a 32 pounder; (2) by the diameter of the bore; as, a 12-inch gun; or (3) by the weight of the gun itself; as, an 8-hundredweight gun; a 5-ton gun. Before the introduction of armor plating, the naval guns in use in line-of-battle ships and frigates were 68 pounders (95 hundredweight), 8-inch shell-guns (95 hundredweight),

Steel Field-gun (Army).

and 32 pounders (42 to 58 hundredweight). Now ships are spoken of as armed with 6", 12", 18", 24", 32", etc., ton guns, the 18-ton gun throwing 400-pound projectiles, and the 24-ton gun 600 pound, and so on, the weight of the ball rising with the weight of the piece. Cannon weighing more than 100 tons have recently been constructed. The 10-ton gun is charged with 340 pounds of powder, and discharges a ball of steel or chilled iron weighing 2,000 pounds. Cannon of the smaller calibers are mounted on wheeled carriages for service as field-pieces. In the United States army the guns in service are 8-, 10-, 12-, 15-, and 20-inch smooth-bore Rodman guns, and 3-, 3.2-, 4.5-, 8-, and 12-inch rifled guns. The American 8-inch rifled gun is the 10-inch Rodman smooth-bore, lined with a coiled wrought iron or steel tube. The 3.2-inch gun is a steel field-piece. In the United States navy, 6-, 8-, and 10-inch steel guns have been adopted for the cruisers of recent design. The principal parts of a cannon are: 1st, the *bore*, which is the mass of solid metal behind the bottom or end of the bore, and extending to the base-ring; 2d, in muzzle-loading cannon, the *cascabel*, a projection in rear of the base-ring, including the *knob*, the spherical part between the knob and the base-ring being called the *base of the knob*; 3d, the *vent*, the thickest part of the cylinder, extending from the base-ring forward; 4th, the *trunnions*, which project on each side, and serve to support the cannon; 5th, the *bore or caliber*, the interior of the cylinder, wherein the powder and shot are lodged, and which may be smooth or rifled, though rifled cannons have virtually superseded the smooth-bores; 6th, the *muzzle* or *mouth* of the bore. Cannon are often made so as to be loaded at the breech, various devices being employed to effect this object. Cannon were formerly classed as whole cannons, demi-cannons, culverins, sakers, etc., but are now classified as guns, howitzers, carronades, and mortars; also as field, mountain, coast, sea-, and siege-guns. See *gun*.

2. In *mach.*, a hollow cylindrical piece through which a revolving shaft passes, and which may revolve independently, and with a greater or less speed than that of the shaft. Such, for example, is the prolongation of the eye of a wheel when bored to fit a spindle or shaft on which it is intended to work loose, as the part *a* of the wheel *A*, loose on the shaft *b*.

canonization (kan'on-i-zā'shən), *n.* [= F. *canonisation*, < ML. *canonizare*, canonize: see *canonize*.] In the *Rom. Cath. Ch.*, the act of enrolling a beatified person among the saints. See *beatification*. Originally each bishop was accustomed to declare that particular deceased persons should be regarded as saints; but the exercise of this power was gradually assumed by the popes, who since 1179 have exercised the exclusive right of canonization. In order to canonization, it must be shown that two miracles have been wrought by the candidate before beatification, and two more after it by his intercession. The pope, on application, resumes the case of the beatified person, with the view of testing his qualifications for the higher rank which is claimed for him. A secret consistory is summoned, at which three cardinals are appointed to inquire into the matter, who make their report at a second private meeting. In the third, which is a public consistory, one person, called the *advocatus diaboli*, or devil's advocate, attacks the person to be canonized, raises doubts as to the miracles said to have been wrought by him, and exposes any want of formality in the procedure; while another person, called *advocatus Dei*, or God's advocate, supports his claim. Lastly, a fourth consistory is held, in which the votes of the prelates are taken for or against the canonization. If a plurality of votes are cast in favor of the candidate, the pope announces the day appointed for the ceremony, which takes place at St. Peter's. Also spelled *canonisation*.

The word *cant* may thus have become associated with beggars; but there may have been also an allusion to a perfunctory performance of divine service, and hence a hypocritical use of religious phrases.] I. *intrans.*

1. To speak with a whining voice or in an affected or assumed tone; assume a particular tone and manner of speaking for the purpose of exciting compassion, as in begging; hence, to beg.

II. *trans.* To use as a conventional phraseology or jargon.

After the third century it was allowable to add other parts in harmony with the *canto fermo*, which was then assigned to the tenor voice and sung without change, the other parts moving above and below it in counterpoint more or less free, the composer being at liberty to give to each syllable as many notes, and to arrange them in such manner, as his taste and his ideas of harmony and fitness dictated. These additional parts, being more elaborate and ornamental than the *canto fermo*, were called, in contradistinction to it, *canto figurato*.

5. Pertaining to the phenomenon of the rise of fluids in tubes and channels, and, more generally, to the cohesiveness of liquids in drops,

their spreading over surfaces (as oil on water), and various other phenomena explicable proximately by surface-tension and ultimately by cohesion and adhesion, considered as forces acting at finite but insensible distances. —6. In *surg.*, linear; descriptive of a fracture of the skull without separation of the parts of the injured bones. **Capillary antennae**, in *entom.*, antennae in which the joints are long, slender, and very loosely articulated, the outer ones being generally a little longer; this is regarded as a modification of the clavate type. —**Capillary attraction, capillary repulsion**, the excess or deficiency of the attraction of one of two fluids (the other being generally air) for the wall of a vessel with which they have a common line of contact. The common surface of the wall and of the more attracted fluid makes the outer angle with the common surface of the fluids. Capillary attraction is proximately accounted for by surface-tension; but the latter has to be explained by the attractions between the molecules of the fluids. See *capillary tubes*, below. —**Capillary bottle**, a bottle with a dropping-tube, used in preparing objects for the microscope. —**Capillary bronchitis**. See *bronchitis*. —**Capillary electrometer**. See *electro-capillary*. —**Capillary filter**, a simple water-filter, consisting of a cord of loose fiber, as a cotton candle-wick, one end of which is placed in the water, while the other end hangs over the edge of the vessel. The water is drawn through the cord by capillary action, without its impurities. —**Capillary pyrites**, in *mineral*. See *millrite*. —**Capillary repulsion**. See *capillary attraction*, above. —**Capillary tubes**, tubes with very small bores, of which the diameter is only a half, a third, a fourth, etc., of a line. If a tube of this sort, open at both ends, is taken and one of its ends immersed in water, the water will rise within the tube to a sensible height above the surface of the water in the vessel, the height being inversely as the diameter of the bore; that is, the smaller the bore the greater the height. Different liquids rise in capillary tubes to different heights. The rise is explained by the action of cohesion as a force acting at insensible distances (hence called *capillary attraction*), which produces a tension of the superficial film of the liquid (see *surface-tension*) that exerts a pull upward where the surface is concave, as when the tube is moistened by the liquid (as glass or metal by water, alcohol, etc.), but a pressure downward where the surface is convex; consequently, those liquids which do not adhere to or wet the surface of the tube immersed in them stand lower within than without. Mercury, for example, is depressed in a glass tube, but rises in one of tin, to which it can adhere. The oil rises in the wick of a lamp or candle by this principle. —**Capillary vessels**, in *anat.*, the capillaries.

In *polit. econ.*, that part of the produce of industry which, in the form either of national or of in-

dividual wealth, is available for further production; an accumulation of the products of past labor capable of being used in the support of present or future labor.

What *capital* does for production is to afford the shelter, protection, tools, and materials which the worker requires, and to feed and otherwise maintain the laborers during the process. . . . Whatever things are destined for this use—destined to supply productive labor with these various prerequisites—are *capital*.

As commonly used to indicate financial resources, it implies ownership, and does not, without qualification, include borrowed money. With reference to a corporation, it is the aggregate of the sum subscribed and paid in, or secured to be paid in by the shareholders, with the addition of all undivided gains or profits realized in the use and investment of those sums; or if losses have been incurred, then it is the residue after deducting such losses. See *stock*.

The characteristic feature of the *capitalistic* system of production is that industry is controlled by capitalists employing free wage-labor; that is, while the capitalist owns and controls the means of production, the free laborer has lost all ownership in land and capital and has nothing to depend on but his wage. The antennæ are long, often with the second joint thickened at the tip, and very slender terminal points; the labrum is long; ocelli are wanting; the legs are long and slender, with 3-jointed tarsi sometimes provided with pulvilli. The females have a long slender ovipositor received in a slit under the abdomen. They are active bugs, and subsist on the juices of plants and trees; some are particularly fond of ripe fruit. Shak., 1 Hen. VI., i. 1.

2. Figuratively, one who is charmed or subdued by beauty or excellence, by the lower passions of his own nature, or by the wiles of others; one whose affections are seized, or who is held by strong ties of love or any other passion.

Yet hath he been my *captive* and my slave,

And begg'd for that which thou unask'd shalt have.

Shak., Venus and Adonis, l. 101.

= *Syn.* 1. *Prisoner*, *Captive*. The word *prisoner* emphasizes the idea of restraint of liberty, but is not rhetorical or especially associated with feeling: the *prisoner* of war and the *prisoner* for crime may be shut up in a prison, kept by guards within defined limits, or given a restricted liberty on parole. The word *captive* suggests being completely in the power of another, whether confined or not; it has come to be a rhetorical word, suggesting helplessness and resulting unhappiness. Captured soldiers under guard are strictly *prisoners*, but are often and properly called *captives*. When we speak of a *captive* bird, we suggest its longing for liberty. The rights and interests of a *prisoner* are likely to be respected, but the *captive* may be abused or even sometimes sold into slavery. See *captivity*.

Come, Sleep! O Sleep! the certain knot of peace,

The bating-place of wit, the balm of woe,

The poor man's wealth, the *prisoner's* release,

Th' indifferent judge between the high and low.

Sir P. Sidney, Astrophel and Stella, st. 39.

Go, see the *captive* harrowed as a slave!

Crushed till his high, heroic spirit bleeds.

Carabidae (ka-rab'i-dē), *n. pl.* [NL., < *Carabus* + *-idae*.] A family of *Coleoptera* or beetles whose metasternum has an antecoxal piece separated by a well-marked suture, reaching from one side to the other, and extending in a triangular process between the hind coxæ, with the antennæ 11-jointed, and the hind coxæ movable and small. The antennæ arise at the side of the head between the base of the mandibles and the eyes. The species are usually large and adorned with brilliant metallic colors, and are either wingless or have wings not adapted for flying. There are more than 6,000 known species, all of which are commonly called *ground-beetles*, varying from a very minute size up to 2 or 3 inches in length. The bombardier-beetle, *Brachinus crepitans*, belongs to this family. Other names of the caraboid group of insects are *Carabi*, *Carabici*, *Carabida*, *Carabini*, *Carabidae*, *Carabites*, *Carabidea*, *Carabides*, *Carabina*. The typical genus of *Carabina*, now restricted to species of medium or large size and handsome coloration, having the third antennal joint cylindrical, the labrum not furcate, the mandibles with no external setigerous puncture, the posterior coxæ contiguous, and the anterior coxal cavities open behind. There are many species, especially in Europe, where the genus reaches its highest development. *C. scutellatus* is the commonest American species, & to [?] of an inch long, black, with bluish edges of the prothorax and elytra, the latter being punctate.

These are large, vulture like birds, of terrestrial, ambulatory, not saltatory, habits, preying chiefly upon carrion. The head

and neck are extensively denuded; the legs and wings are comparatively long; the beak is toothless, with the cere ending vertically, the nostrils high up, linear, and oblique, with concealed tubercle. The common caracara is much varied with white and black barring of the plumage, and is about 22 inches long. Also called *carcara* and *carrancha*.

 vessel contains a black substance to which the name of
 caramel has been given. It has a high luster, like am-

 savor. Its composition is the same as that of cane

 rygian fishes, represented by the genus *Carangus*,
 to which various limits have been assigned.
 In Linnaeus's system, a family of *Acanthopterygii cot-
 ta-scoleciformes*, with the skeleton firm, no bony stay for
 the pectoral fin, teeth conical or triangular if present, the
 spinous portion of the dorsal fin sometimes rudimen-
 tary; the body compressed, oblong or elevated, with
 10 abdominal and 14 caudal vertebrae. In this sense it
 has been used by most European ichthyologists since 1862.
 It includes fishes which have been distributed by others
 in the families *Carangidae*, *Pomatomidae*, *Psettidae*, *Zan-
 clidae*, *Carangidae*, *Eupomidae*, etc. (b) In Gill's system re-
 stricted to *Scorpaenidae* with 10 abdominal and from 14
 to 20 caudal vertebrae, a stout or atrophied first dorsal
 fin, second dorsal and anal long, opposite, and nearly
 equal, generally two and spines detached and forming a
 hook and non-protractile jaws. These limits have been
 adopted by most recent American ichthyologists. It in-
 cludes numerous species of tropical fishes, the best known
 of which are the cavalies, pompanos, and pilot-fish.

Carangidae is the family name for the fishes generally
 known as cavalies or cavalie, jack, pompano, sea-dog, etc.

 nuchal spine is protractile, the pectoral fins long and lat-
 eral, the anal fin like the second dorsal and with its base
 anterior to the pectoral fin, the maxillary has a supplemen-
 tary tooth, the jaw with a small curved tooth, the ven-

 bark of which is in spots as a tomentum. Oil made from
 its seeds, called *carapace* or *carapace* oil, is used for lamps.
 The wood, called *carapace* or *carapace* wood, is light and
 takes a good polish; it is used for making furniture, and
 also for the spars of ships. The oil of the African species,
C. Pongolensis, called *carapace*, *carapace*, or *carapace* oil,
 is used by the negroes for making soap and anointing the ir-
 bodies, its taste being so bitter that it serves as a defense
 against bites of venom. The oil of the South American
 species is used for the same purpose.

 like L. *siliqua* (see *siliqua*), a weight, the carat,

14. An old weight equal to a scruple, or the
 twenty-fourth part of an ounce troy.—24. A
 unit of mass formerly used in various countries
 for weighing gold. It was generally the 24th part
 of a mark of gold, and was subdivided into 12 grains.
 Hence —3. A twenty-fourth part; specifically
 used in expressing the fineness of gold when
 used as jewelry. The pure gold being considered as
 24 carats, if two sixths or ten twenty-fourths of alloy
 commonly called silver be present, the gold is said to
 be 22 carats, or 14 carats fine, and so on. The gold used by

jewelers is seldom over 18 carats fine, except in wedding
 rings, the standard fineness of which is 22 carats. Gold
 of 18 carats fine is almost invariably used in mounting
 diamonds, while 14-carat gold is used for gold chains, etc.

4. A unit of weight for precious stones, divided
 by jewelers into 4 grains, called *diamond-grains*,
 but equal to about 3½ troy grains, 151½ English
 carats being taken as equal to an ounce troy.
 In 1877 the weight of the carat was fixed by a syndicate
 of London, Paris, and Amsterdam jewelers at 205 milli-
 grams, or 141.76 carats to the troy ounce. Under the
 translated form *keparion*, or *caration*, *siliqua* was adopted
 by Constantine into the system of weights of the empire
 as 1/17 of an ounce, equal to 189 milligrams. In Italy it re-
 mained as a part of the system of weights, in general with
 the same relation to the ounce and with nearly the same
 value. The Arabic *qirât* was the 24th part of the *mithkal*,
 and was subdivided sometimes into 4, sometimes into 3
 grains, its value for gems being very nearly 3 grains
 troy. The Castilian carat, 1/17 of a Castilian ounce, or
 3.164 troy grains, was, like the rest of the Castilian sys-
 tem, adopted from the Arabs. From Spain this has passed
 to the rest of Europe and to America, with only small
 modifications, less than unalloyed units commonly un-
 dergo, under the name of the *Amsterdam* or *diamond*
carat, which is usually divided into 64ths. Pearls are sold
 by the diamond-grain and not by the carat, while small
 baroque pearls, coral, rough garnets, and the inferior
 kinds of stones are sold by the ounce troy. The subdivi-
 sions of the carat are always expressed in fourths, eighths,
 sixteenths, etc.

1. A company of travelers, pilgrims, or
 merchants, in many parts of Asia and Africa,
 who associate together that they may travel
 with greater security, especially through des-
 erts or regions infested by robbers. Nearly all
 commerce in these countries was formerly carried on by
 caravans, using camels chiefly for transportation; and
 they are still numerous, though largely superseded by
 other methods.

2. Figuratively, any large number of persons
 traveling together, especially when moving
 slowly or with much baggage; poetically, any
 large number of persons, or even animals, con-
 sidered as traveling together to a common des-
 tination.

To that mysterious realm . . . of death.

 passengers, or a company of people traveling
 together, or a traveling exhibition or show;

carbolic (kär-bol'ik), *a.* [*< carb(on) + -ol + -ic*.] Pertaining to or derived from carbon or coal.

Carbolic acid, a substance ($\text{C}_6\text{H}_5\text{OH}$) found in that part of the heavy oil of coal-tar which distils over between 329 and 374 F. From this product of condensation it is almost exclusively prepared. It has feebly acid properties, but in chemical structure is allied to the alcohols, and belongs to a class of compounds called *phenols*. When pure it crystallizes in white or colorless needles, which have the odor of creosote and a burning taste. They deliquesce readily and become liquid. It is an irritant poison when taken in large doses, but in doses of from 1 to 3 grams it is used internally as a therapeutic agent. Its chief medicinal use, however, is as a disinfectant in antiseptic surgery, and as an external application to unhealed sores, compound fractures, abscesses after they have been opened, and tissues that are exposed as a result of surgical operations. The action of the acid is not only to exclude germs that induce putrefaction, but also to destroy such as may have been admitted, for which reason it is introduced into the interior of the wound. Also called *phenic acid*.—**Carbolic-acid paper**, wrapping-paper saturated with steam and carbolic acid, used for preserving meats, etc.

carbon (kär'bon), *n.* [= *F. carbone* = *Sp. carbono* = *Pg. carbone* = *It. carbonio*, *< NL. carbo(n-)*, carbon, mod. forms, in chem. sense; cf. *F. charbon* = *Pr. carbo* = *Sp. carbon* = *Pg. carvão* = *It. carbone*, a coal, coal, older forms, in orig. sense; *< L. carbo(n-)*, a coal, whether a glowing coal or a dead coal, charcoal.] 1. Chemical symbol, C; atomic weight, 11.97. An element found in nature in two distinct forms: the diamond, which is extremely hard, of high specific gravity (3.5), usually colorless and transparent, with brilliant adamantine luster, and crystallizes in octahedrons; and graphite, which is very soft, of low specific gravity (2), black and opaque, with metallic luster, and crystallizes in hexagonal plates. See *diamond* and *graphite*. Its physical properties vary greatly with its different forms. It is combustible, burning to carbonic acid (CO_2). In combination it is universally distributed through the animal and vegetable kingdoms being a constituent of every living tissue. By the action of heat on such tissues, with partial or complete exclusion of air, carbon is procured in amorphous form more or less mixed with other matters. Such products are animal charcoal, lampblack, wood charcoal, coke, and gas-carbon. The number of its compounds with the other elements is endless; and at present more compounds of carbon are known, probably, than of all other elements taken together. It is present in the atmosphere as carbon dioxide, or carbonic acid gas, and in the same form in some mineral waters; it also appears in the salts called carbonates, as calcium carbonate in coral, in the shells of many sea-animals, in the common mineral calcite, including chalk, limestone, marble, etc., and as iron carbonate in the mineral siderite, etc.

2. The form of the diamond generally called *carbonado*; the black diamond.—3. In *electric lighting*, a carbon-point (see below).—**Bisulphid of carbon**. See *bisulphid*.—**Carbon dioxide**. Same as *carbonic acid* (which see, under *carbonic*).—**Carbon-points**, in *electric lighting*, two rods of very hard, compact carbon, between which the electric arc is formed, producing a light of great brilliancy. See *carbon arc*, under *arc*, and *electric light*, under *electric*.—**Carbon process**, in *photog.*, a process of producing photographic positive pictures in a pigment composed of carbon, in order to insure their permanency. The thin paper on which the impression from the negative is taken is coated with gelatin colored with the carbon pigment, and sensitized, usually with bichromate of potash. After exposure to light under the negative it is affixed face downward upon another sheet of paper, and is plunged with it into a hot-water bath, which dissolves the first paper and leaves the gelatin film uncovered. The water dissolves those portions of the film which have not been rendered insoluble by the action of light through the transparent portions of the negative upon the sensitizing medium, and the more or less insoluble portions of the film form a positive picture, which is, however, reversed in its relations of right and left. If a second transfer of the film from its support to restore these relations in the finished print is required, the first transfer is not made to a paper surface, but to a sheet of glass, zinc, or ebonite. The same end may be accomplished without the second transfer, by stripping the negative film from the glass, and printing with its face outward, by reversing the right and left of the negative by the use of a prism, or by other de-

This is an important class of ores in Colorado and Utah.—**3.** Same as *carbonado* or *hort.* [*kare.*] **Hard carbonates**, salts containing carbonic acid with iron for a base. **Soft carbonates**, salts containing carbonic acid with a base of lead.

carbon-button (kär-bōn-but'n), *n.* A small disk of carbon, usually of compressed lampblack, used in a form of telephone invented by Edison. The resistance which it offers to the passage of an electric current depends upon the pressure to which it is subjected, so that when it forms a part of a circuit of constant electromotive force the current strength will vary with variations of pressure on the disk. See *carbon telephone*, under *carbon*.

carbonic (kär-bōn'ik), *a.* [= *F. carbonique* = *Sp. Pg. It. carbonico*, *< NL. carbonicus*, *< carbo(n-)*, carbon; see *carbon* and *-ic*.] Pertaining to carbon, or obtained from it.—**Carbonic acid**, CO₂, more properly called *carbonic anhydride* or *carbon dioxide*, a gaseous compound of 12 parts by weight of carbon and 32 of oxygen, colorless, without smell, 22 times as heavy as hydrogen, and existing in the atmosphere to the extent of 1 volume in 2,500. It is reduced to a liquid by high pressure and cold; and it is obtained as a solid white substance by means of the intense cold produced by the sudden expansion of the liquid when allowed to escape from pressure. It has a pleasant, acidulous, pungent taste, and aerated beverages of all kinds—beer, champagne, and carbonated mineral water—in part owe their refreshing qualities to its presence; for, though poisonous when taken into the lungs, it is harmless when taken into the stomach in moderate quantity. Dissolved in water, it forms a dibasic acid, COOH₂, whose salts, the carbonates, are widely and abundantly distributed in nature. It is incapable of maintaining combustion or animal life, acting as a narcotic poison when present in the air to the extent of only 4 or 5 per cent. It is disengaged from fermenting liquors and from decomposing vegetable and animal substances, and is largely evolved from fissures in the earth, constituting the choke-damp of mines. From its weight it has a tendency to subside into low places, vaults, and wells, rendering some low-lying places, as the upas valley of Java, and many caves, uninhabitable. This gas is formed and given out during the respiration of animals, and in all ordinary combustion, from the oxidation of carbon in the fuel. It is evolved from the colored parts of the flowers of plants both by night and day, and from the green parts of plants during the night. In direct or diffuse daylight, plants absorb it energetically from the atmosphere through their leaves, and decompose it, assimilating the carbon, and returning most of the oxygen to the air.

Carbonic-acid engine. (a) A fire-engine from which water is ejected by the pressure of carbonic acid gas, which is evolved in a chamber connected with the water-reservoir. (b) An engine which is moved by the expansive force of condensed carbonic acid.—**Carbonic-acid water**. See *aerated waters*, under *aerate*. **Carbonic or carbonous oxid**, a substance (CO) obtained by allowing carbonic acid to pass over red-hot fragments of charcoal, contained in a tube of iron and porcelain, and also by several other processes. It is a colorless, odorless gas, a little lighter than air, has neither acid nor alkaline properties, is very poisonous, and burns with a pale lavender flame. This substance is produced when a coal fire burns with a smokeless flame, and the pale lavender flame produced by its combustion may often be observed playing over such a fire.

carboniferous (kär-bō-nif'e-rūs), *a.* [*< L. carbo(n-)*, coal, + *ferre* = *F. bear*.] Containing or yielding carbon or coal. In *geol.* almost exclusively used in designating that assemblage of strata from which the coal of England, France, Germany, and the United States for the most part obtained. The Carboniferous series of the Paleozoic age, and is the most recent portion of the Paleozoic. It is overlain by the Permian rock, which belongs to the closing era of the Carboniferous age, and is underlain by the Devonian. The Carboniferous over large areas both in Europe and North Amer-

ica, is separable into three more or less distinct groups: the coal-measures, the millstone-grit, and the mountain limestone. The first of these is a series of shales and clays, with which the coal-beds themselves are interstratified. This part of the series is sometimes several thousand feet in thickness, and the number and thickness of the intercalated coal beds differ greatly in different regions. The millstone-grit is a detrital rock ordinarily quite silicious, and assuming all degrees of fineness, from that of a fine-grained griststone to that of a coarse conglomerate. Its thickness varies greatly in various regions. The mountain limestone is a calcareous rock, often rich in fossils of marine origin, and sometimes having a thickness of over 3,000 feet. See *coal*, *coal-measures*, *millstone grit*, and *mountain limestone* (under *limestone*). (In technical use, commonly with a capital.)

When all the brakes of a train are operated together by a single application of power, the apparatus is called a *continuous brake*. The most important forms of such brakes are the Westinghouse brake and the vacuum-brake. (See *air-brake*.) carcinoma (kär-si-nō'mä), *n.*; *pl. carcinomata* (mā-tä). [L. (also in aecom. form *canceroma*, *canceromata*) < *F. carcinome* = *Sp. Pg. It. carcinoma*, < Gr. *καρκινωμα*, a cancer, < *καρκινος*, affect with cancer, < *καρκινος*, a crab, cancer: see *carcinus* and *cancer*.] A tumor which grows more or less rapidly, tends to break down and ulcerate in its later stages, propagates itself in neighboring or more distant parts, and after excision very frequently recurs; a cancer, in the stricter sense of that word.

A carcinoma is characterized microscopically by trabeculae and nodular masses of cells of epithelial form and origin, running in a stroma of tissue of mesoblastic origin. Several types are distinguished: (1) flat-celled epithelioma; (2) cylinder-celled epithelioma; (3) simple carcinoma (carcinoma simplex), a variety of glandular carcinoma forming nodular tumors of considerable consistency; (4) carcinoma scirrhosum, or scirrhous cancer, a variety forming very hard nodules of almost the consistency of cartilage; (5) carcinoma gelatinosum, or cancer with colloid degeneration of the epithelial parts; colloid cancer; (6) carcinoma myxomatous, or cancer with the stroma consisting of mucous tissue; (7) cylindroma carcinomatodes; (8) carcinoma gigantocellulare; (9) melanocarcinoma. Certain pathologists exclude the epithelioma from the carcinomata, and hold that the latter are not of epithelial origin, but are purely mesoblastic formation. Some, again, founding the definition of carcinomata entirely on anatomical features, independently of histogenetic considerations, include in them the sarcoma alveolaria. The softer carcinomata are as a rule the more rapidly fatal. The earlier a cancer is removed, the greater is the prolongation of life and the chance of escaping a return. See *cylindroma*, *epithelioma*, *sarcoma*.—**Alveolar carcinoma**. See *alveolar*.

Extraordinary care, ordinary care. See the adjectives.—Take care, be careful; beware.—To have a *care*. See *have*.—To have the *care* of, to have charge of.—Syn. *Care*, *concern*, *solicitude*, *anxiety*. *Care* is the widest in range of meaning; it may be with or without feeling, with or without action; as, the *care* of a garden. In its strongest sense, *care* is a painful burden of thought, perhaps from a multiplicity and constant pressure of things to be attended to; as, the child was a great *care* to her. *Concern* and *solicitude* are a step higher in intensity. *Concern* is often a regret for painful facts. *Care* and *concern* may represent the object of the thought and feeling; the others represent only the mental state; as, it shall be my chief *concern*. *Solicitude* is sometimes tender than *concern*, or is attended with more manifestation of feeling. *Anxiety* is the strongest of the four words; it is a restless dread of some evil. As compared with *solicitude*, it is more negative; as, *solicitude* to obtain preferment, to help a friend; *anxiety* to avoid an evil. We speak of *care* for an aged parent, *concern* for her comfort, *solicitude* to leave nothing undone for her welfare, *anxiety* as to the effect of an exposure to cold. (For *approachism* and higher degrees of *care*, see *alarm*.)

A mendicant friar of the order of Our Lady of Mount Carmel.

This mountain, overlooking the bay of Acre in northwest Palestine, has been from early times a resort for hermits, and in the twelfth century a Carmelite monk, in obedience to a professed revelation from the prophet Elijah, built there a tower and a church and gathered around him about ten companions. From this small beginning arose the Carmelite order. According to an early rule, the monks were to live in separate cells, to abstain from meat, and to observe a strict fast from the Exaltation of the Cross (September 14th) to Easter, Sundays being excepted. Owing to Mohammedan persecutions, the Carmelites abandoned Mount Carmel and established themselves in 1238 in Cyprus and elsewhere. In the sixteenth century St. Theresa, a Spanish lady of noble family, built a convent at Avila and established a disordered or reformed branch of the order, consisting of both monks and nuns, sometimes called *barefooted Carmelites*. The habit of the order is a cassock, scapular, and hood of brown color, and a white cloak, the hood covering the head and face and having holes for the eyes. In the United States there are convents of the order in the dioceses of Leavenworth, Newark, Pittsburgh, Baltimore, St. Louis, and New Orleans. I. n. The principal artery of the neck of the higher vertebrates. There are usually two carotids, right and left, giving off few if any branches in the neck itself, but supplying the head. In man, the right carotid arises in common with the right subclavian from the innominate artery; the left arises directly from the arch of the aorta; both ascend the neck nearly vertically, but somewhat divaricating from each other, in front of the spinal column and on each side of the trachea, inclosed with the pneumogastric nerve and internal jugular vein in the carotid sheath, and divide opposite the upper border of the thyroid cartilage into the *internal* and *external carotids*; up to this division the right and left carotids are termed the *common carotids*. The *external carotids* are the outer of the terminal branches of the common carotids, supplying mainly parts of the head outside the brain cavity; their branches are the superior thyroid, lingual, facial, occipital, posterior auricular, ascending pharyngeal, internal maxillary, and temporal arteries. The *internal carotids* are the inner of the terminal branches of the common carotids, ascending deeply along the side of the neck and entering the cavity of the cranium through the carotid canal in the temporal bone, supplying the brain and associate structures. (See cuts under *embryo* and *lung*.) A similar arrangement of the carotids is substantially repeated in mammals. In birds the disposition of these arteries varies much, but in most cases there is but one carotid, the left, or sinistrecarotid. Also *carotis*.

II. a. Of or pertaining to the two great arteries of the neck: as, the *carotid canal*. Also *carotic*.

Also called *cavernous groove*.—**Carotid nerve**. (a) A branch of the glossopharyngeal which accompanies the internal carotid artery. (b) The large deep petrosal nerve. (c) The sympathetic nerve running up along the internal carotid artery from the first cervical ganglion.—**Carotid plexus**, the plexus of sympathetic fibers lying on the outer side of the internal carotid while in the carotid canal.—**Carotid sheath**, a membranous envelop encasing the common carotid artery, internal jugular vein, and pneumogastric nerve.—**Carotid tubercle**, the prominent anterior tubercle of the transverse process of the sixth cervical vertebra, against which the common carotid artery may be compressed.—**Cerebral carotid artery**. =**Syn.** *Revel*, *Carousal*, *Wassail*, *Spree*, *Debauch*, *Saturnalia*. *Orgy* agree in expressing times of excess in drinking; some of them include other sensual pleasures. They are in the order of strength and consequent reprobation implied. A *revel* is accompanied with some drunkenness,

disorder, and noise. A *carousal* is by derivation a time of drinking deeply; it may be a bacchanalian feast, a noisy, unrestrained drinking bout. *Wassail* is limited by its associations with the past so as to be chiefly poetic or to express deep drinking. *Spree* is considered a colloquial word, but seems likely to win recognition as a convenient word for a period of drunkenness which invites to wild and reckless action. *Debauch* is distinctively excess, having less reference now than formerly to eating, applying chiefly to gross lewdness or drunkenness, which is often prolonged. *Saturnalia*, like *wassail*, has historical associations; it is a strong word for license, noisy revelry, gross and continued debauchery. *Orgy* is by derivation a secret nocturnal debauch, and by usage a time of joining in a wild or frantic abandonment to drunkenness or lust, or both—the extreme in that kind of misconduct. See *feast*.

It is said to have been introduced into England in the fourteenth century. It is an excellent fish for ponds, as it breeds rapidly, grows to a large size, sometimes attaining the length of 4 feet, and lives for many years. In old age its scales become gray and white. There are numerous varieties, the most notable being (a) the normal form or *scale carp* just described, (b) the *mirror-carp*, distinguished by very large scales below the dorsal,

above the anal, and in a median posterior row, and (c) the *leather-carp*, characterized by its almost or quite naked skin. The last two have long been the subjects of special culture, and have been widely distributed in the United States.

A teleostean fish of the family *Cyprinidae*, *Cyprinus carpio*. The normal form has a long compressed body, large scales (35 to 39 being along the lateral line), a long dorsal with a strong serrate spine and 17 to 22 rays, a short anal with 3 simple and 5 branched rays, and 4 barbels upon the upper jaw. It is said to have been introduced into England in the fourteenth century. It is an excellent fish for ponds, as it breeds rapidly, grows to a large size, sometimes attaining the length of 4 feet, and lives for many years. In old age its scales become gray and white. There are numerous varieties, the most notable being (a) the normal form or *scale carp* just described, (b) the *mirror-carp*, distinguished by very large scales below the dorsal,

above the anal, and in a median posterior row, and (c) the *leather-carp*, characterized by its almost or quite naked skin. The last two have long been the subjects of special culture, and have been widely distributed in the United States.

A thick fabric, usually woven of wool, or of wool on a linen ground or back, and in more or less ornamental designs, used for covering floors, stairs, etc. Formerly the carpet (usually in a single

piece, like the Persian carpet) was also used (as it still is in the East) for covering beds, couches, tables, etc., and for hangings. (See *tapestry*.) The first woven carpets were produced in Egypt, Babylonia, Persia, and Hindustan, whence they were introduced into Europe, where they are supposed to have been first manufactured by the French in the reign of Henry IV., and next in England, at Mortlake in Surrey, in the reign of James I. The smaller carpets of the East are now commonly called *rugs*. See *rug*.

Aubusson carpet, a carpet made at Aubusson in France. It is made in one piece, in the hand or needlework style of the Indian carpets, and is highly esteemed for the elegance of its designs and coloring. — **Axminster carpet**, a variety of Turkish carpet with a chain of flax or jute, and a woolen or worsted filling made into a pile: so named from the town of Axminster in Devonshire, England, where it was formerly manufactured. — **Brussels carpet**, a carpet of a kind originally made in Brussels, having a heavy linen web inclosing worsted yarns of different colors, which are raised in loops to form the pattern. In the ordinary Brussels carpet both the pattern and the ground are left with the loops uncut; in the imperial Brussels carpet the pattern is raised above the ground, and its loops are cut so as to form a pile, those of the ground being uncut. — **Chenille carpet**, a carpet in which the web is of chenille instead of yarn. The pattern is dyed in the chenille itself, nothing showing at the surface of the carpet but the ends of the chenille fringe. — **Felt carpet**, a carpet in which the fibers are matted or felted together without spinning or weaving. — **Ingrain carpet**, a carpet made of wool dyed in the grain, or before it is manufactured. It is called *Scotch* or (in England) *Kilburnminster*, from the place where it is made, and *two-ply* or *three-ply*, according to the number of webs composing the fabric. — **Paper carpet**, a floor covering (plain or in imitation of ornamental woods) made of a hard and tenacious paper called *hessian*, which is made by subjecting the paper-pulp to the action of chlorid of zinc and then to strong pressure, by which means the product is rendered hard and tough like leather.

Persian carpet, a carpet made in one piece, instead of in breadth or strips to be joined. The warp and weft are of linen or hemp, and the tufts of colored wool are inserted by twisting them around the warp all along the row according to the wearer's taste, no pattern being used. A line of tufts being inserted, a shoot of the weft is made, and then beaten up to close the fabric. — **Pile carpet**, a carpet made in the same way as Brussels carpet, but having its loops cut, thus forming a pile or soft surface. — **Printed carpet**, a carpet dyed or printed in colors; it is either woven in dyed colors and printed like calico, or the yarn is dyed in sections, which are adjusted according to their future position in the fabric. — **Scotch carpet**. Same as *ingrain carpet*. — **To be on the carpet** (more commonly on the *tapis*, see below), literally, to be on the tablecloth or table, as for consideration; hence, to be under discussion; be the subject of deliberation or of intended action; a translation of the French phrase *être sur le tapis* (*tapis*, tablecloth, carpet, etc.; see *tapestry*). — **Turkish or Turkey carpet**, a carpet similar to the Persian, distinguished by the selection of the tufts of colored wool according to the pattern followed, and the manner of their attachment to the back. The cutting of the yarn gives it the appearance of velvet. — **Venetian carpet**, a carpet with a warp or chain of worsted, generally arranged in different-colored stripes. — **Wilton carpet**, a variety of Brussels carpet in which the loops are cut open into an elastic velvet pile: so named from being made originally at Wilton in England.

Specifically—2. One who for hire undertakes the conveyance of goods or persons. The law distinguishes between *common carriers* and *private or special carriers*. One who carries not as a business, but only on occasion by special agreement, is termed a *private or special carrier*. One who holds himself out as a carrier, inviting the employment of the public generally, is a *common carrier*. might have prevented by special care. The most familiar classes of common carriers are railroad companies, stage-coach proprietors, expressmen, truckmen, ship-owners, steamboat-lines, lightermen, and ferrymen. The special rules of liability which the law, for reasons of public policy, imposes on common carriers have not been applied in their full extent to the business of drovers, owners of tow boats, log-drivers, and others who do not literally carry the property entrusted to them; nor are telegraph companies deemed common carriers in respect to the messages they transmit.

In *art*, a design of the same size as an intended decoration or pattern to be executed in fresco, mosaic, or tapestry, and transferred from the strong paper on which it is usually drawn either by cutting out the figure and outlining it on the surface to be decorated with a sharp point, or, in the case of a composition, by pricking, and pouncing with a bag of muslin filled with charcoal-dust. A case of wood bound about with marine, containing several iron balls of a pound each and about 400 musket-balls, to be fired from a cannon or howitzer. *Farrow, Mil. Encyc.* — 4. An oval or oblong figure on ancient Egyptian monuments and in papyri, containing groups of characters expressing the names or titles of royal personages and, rarely, of deities: a name given by Champollion. By extension it now commonly signifies both the inclosing ring and its contents. From a very early date, if not from the beginning, an Egyptian king at the moment of

coronation assumed, in addition to his family or personal name, an official, regal, or throne name, which took its

place beside the former, generally preceding it, and thus gave occasion to a double cartouche. In imitation of the German *schilde* employed in a heraldic sense, the cartouche is in English sometimes styled a *shield* or *escutcheon*, or more often merely an oval.

Two names in an oblong inclosure called a *cartouche*. *S. Sharp, Hist. Egypt.*

An elliptical curve, or oval, inclosing a name, always signified that the inclosed name was that of a king or queen; and Champollion gave it the name of *cartouche*, by which it is now called.

H. S. Osborn, *Ancient Egypt*, p. 21.

5. A painted, engraved, or sculptured ornament of irregular or fantastic form, inclosing a plain central space used as a field for inscriptions, etc. Such ornaments were much used during the sixteenth and seventeenth centuries to decorate wainscoting and the title pages of books.

Italian escutcheons are often egg-shaped; but the shield designated by the word *cartouche* has both ends equally curved, and therefore approximates to an ellipse.

cartouset, *n.* A variant of *cartouche*. *Bailey*, 1731.

In the United States the car body is supported upon two independent trucks placed beneath it. Each of these may have two, but usually four, and occasionally six wheels fixed upon revolving axles, whose journal boxes vibrate vertically in pedestals secured to the framework of the truck. The bolster or cross beam which directly supports the car body is in the middle of the framework, and is suspended from it by equalizing bars and suspension strips, in such a way as to distribute the weight upon all the wheels and allow for the sway, or freedom of motion, essential to easy riding. Springs and brake mechanism are attached to the truck. — *Side bearings of a car-truck.* See *bearing*.

cart-saddle (kăr'tsad'l), *n.* The small saddle put upon the back of a draft-horse when harnessed. *Shoat.*

cart-saddle† (kăr'tsad'l), *v. t.* [*ME. cartsadelen*; from the noun.] To harness; yoke.

carucat, carrucat (ka-rö'kä), *n.* [*ML.*, a plow, *L. carruca*, a four-wheeled carriage, *< carrus*, a car: see *car*.] (*Cf. carua*.) In ancient village communities in England—(a) A plow. (b) A plow-team of oxen, yoked four abreast.

It is from the same source. Statistical Account of Scotland also explains the use of the word *carruca* for plow. For the construction of the word involves not 4 yokes of oxen, but 4 oxen yoked abreast, as are the horses in the *carruca* so often seen upon Roman coins. And the Statistical Account informs us that in some districts of Scotland in former times the ploughs were drawn by 4 oxen, or horse, yoked abreast, one tied constantly upon the third cart, another went in the furrow and two upon the fourth, or white land. The driver walked back, waving his cattle by halters, and taking care that each beast had its equal share in the draught.

Scottish, Eng. Vil. Community, p. 63.

carucage, carrucage (kar'ö-käji), *n.* [*ML. carucage* (for *caruacage*), also *caruagium* (after *OF. caruag*), *< carruca*, a plow: see *carua*.] 1. The act of plowing. — 2. A former tax on land or landholders, fixed at a specified sum on each carucate, or about 100 acres of land. It succeeded the Danegeld (which see).

The other term for the unit of the year 1198 is the reputation of a *carucage*, i. e., 100 bushels on each carucate, or hundred acres of land.

Statist. Court Hist., p. 150.

Also formerly *caruag*.

carucate, carrucate (kar'ö-kät), *n.* [*ML. carucata, carrucata*, *< carruca*, a plow: see *carua*.] Formerly, as much land as could be cultivated by one carucat; usually about 100 acres, but the quantity varied according to the nature of the soil and the practice of husbandry in different districts. Also *carua*.

A trace at least of the original sense of the varying contents and relations of the fact and figure is to be

found in the Hundred Rolls, as, indeed, almost everywhere else, in the use of another word in the place of *carucate*, which, instead of the anciently assessed hideage of a manor, its more modern actual taxable value is examined into and expressed. This new word is *carucate*—the hide of a plough or plough team.

Scottish, Eng. Vil. Community, p. 40.

caruet (kar'ö), *n.* [Later misread and miswritten *carue*; *< ME. carue*, *< OF. carue*, *caruce*, *< ML. carucata, carrucata*, a certain portion of land: see *carucate*.] A carucate (which see).

And a *Carue* of Land, Carucata terra, or a Hide of Land, Hida terra (which is all one), is not of any certain content, but as much as a Plough can plough in a Year, and there-with agrees Landard verbo Hyde. And a *Carue* of Land may contain an House, Wood, Meadow, and Pasture, because by them the Ploughman and the Beasts of the Plough are maintained.

Anthony Loue's Case (1630), 9 Coke, 123, 124.

Side Elevation and Section of Passenger-car Truck.

a, a', longitudinal timbers of frame; b, b', transverse timbers; c, swinging bolster; d, center casting; e, e', center springs; f, f', equalizing bars; g, g', elliptic springs; h, h', suspension bar; i, i', vokes; j, j', swing-lugs; k, k', hangers; m, m', upper boxes of the axle; p, p', wheels; r, r', tension-dar (of tie); s, s', and t, safety straps; t, t', brake-bar; u, u', diagonal brace-rods for the pedestals; v, v', relieving springs.

And it was agreed that common way be appendant to a *Carue* of Land, . . . and so a *Carue* of Land consists of Land, Meadow, and Pasture, as it appears by Tiringham's case, 4 Coke, 37 b.

Morse, Webb (1652), 2 Brownlow (& Goldsborough), p. 297.

A small fleshy excrescence, either natural or morbid. Specially—2. In *ornith.*, a fleshy excrescence on the head of a bird, as the comb or one of the wattles of a hen.

It is especially important that the fresh colors of the (bird's) bill, cere, gums, eyes, and feet, or *caruncles*, or bare skin, if there be any, should be noted, as the colors of these parts all change after the preparation of a specimen.

C. F. Hall, Polar Exp., 1876, p. 654.

The Manx have a literature—a native vernacular Gaelic literature. . . . This literature consists of ballads on sacred subjects, which are called *carvals*. . . . It was formerly the custom in the Isle of Man for the young people who thought themselves endowed with the poetic gift to compose carols some time before Christmas, and to recite them in the parish churches. These pieces which were approved of by the clergy were subsequently chanted by their authors through their immediate neighborhoods, both before and after the holy festival. Many of these songs have been handed down by writing to the present time. . . . The *carvals* are preserved in uncouth-looking, smoke-stained volumes, in low farm-houses and cottages situated in mountain gills and glens.

battle of Thermopylae, and that it was on this account sacked by the other Greeks, who took the women captive and to perpetuate this event erected trophies in which figures of women dressed in the Caryatic manner were used to support entablatures. It is the typical genus of the family *Caryophyllæidæ*. *C. nautalis* is found in the intestine of cyprinoid fishes. Originally *Caryophyllus*.

being carried to Cuba (in 1830) rose against their captors, took possession of the vessel, and after changing her colour were taken by a United States vessel on the American coast. The courts held that they were free, and not pirates or robbers.—**Bankers' case**, or **case of the bankers**, the petition of Hornblower and others to the House of Commons in 1691 (14 How. St. Tr., 1) for the payment of certain annuities granted by Charles II. to repay money originally loaned to him on the security of the revenue. On appeal, the House of Lords decided that the grant was binding upon his successor, and continued a charge upon the revenue.—**Bates's case**, an English prosecution (1606) of a merchant, in which the claim of James I. to impose duties as a personal prerogative was sustained: a question afterward settled the other way under Cromwell. Also called the *case of the impositions*.—**Bradlaugh's case**, a prolonged controversy (1881-86) over the claim of Charles Bradlaugh (*a*) to take a seat in the House of Commons without taking the oath required of members, he declaring that he did not acknowledge or believe in its obligation; and later (*b*) to have the oath administered. Two notable legal decisions were reached in the course of the controversy. In 1881 (12 Law Rep. Q. B. D., 271), in the case of Charles Bradlaugh v. Francis R. Gossett, sergeant-at-arms of the House of Commons, arising out of a resolution excluding plaintiff from the House until he should engage not to disturb its proceedings by demanding to take the oath as a member, it was held that courts cannot control the House in its administration of laws relating merely to its internal procedure, a member from doing in the House what he had a lawful right to do, and that action will not lie against the sergeant-at-arms for obeying such resolution. In 1886 (14 Law Rep. Q. B. D., 667), in the Court of Appeal, the case of the Attorney-General v. Bradlaugh, for penalties under the Parliamentary Oaths Act, for voting in the House without having been sworn as a member, in a Supreme Being, and a member who does not believe in a Supreme Being, and upon whom an oath is binding only as a promise, is incapable of taking the prescribed oath; but if he goes through the form of taking it (as Bradlaugh did by administering the oath to himself at the bar of the House), he is liable for violation of the act.—**Burr's case**, the prosecution of Aaron Burr for treason against the United States, tried before Chief Justice Marshall in 1807.—**Calvin's case**, also called the *case of the postnati*, 1608 (2 How. St. Tr., 539; 7 Coke, 1), an action turning on questions of allegiance and natural born subjects. It was brought to recover lands by Robert Calvin against Richard and Nicholas Smith, to which defendants pleaded the action, because he was an alien, and incapable of bringing the crown of England descended to James I., who was also king of Scotland. It was argued by lawyers and judges of the great renown, including Lords Bacon, Coke, Ellesmere, Yelverton, and Warburton, and was decided in favor of the plaintiff.—**Case agreed**, or **case stated**, in law, a statement of facts agreed on by the parties, or made by another court, to be submitted merely for decision of a point of law.—**Case law**. See *law*.—**Case of conscience**. See *conscience*.—**Case of the Caroline**, a name given to the case of the People v. McLeod. See *McLeod case*, below.—**Case of the claimant**. See *Tichborne case*, below.—**Case of the seven bishops**. See *bishops*.—**Case reserved**, **case made**, a statement presenting points of law reserved by the judge or parties for decision by the full court.—**Civil rights cases**. See *civil*.—**Clinton bridge case**, an important litigation in the United States Supreme Court (1870), which established the doctrine by which railroad bridges may be said to have gained clear recognition of their rights of way in preference to the navigable waters crossed by them, through the power of Congress to regulate inter-state commerce.—**Criminal cases**. See *criminal*.—**Crown cases reserved**. See *crown*.—**Darnell's case**, a noted case in English constitutional law (1627), in which the imprisonment of Sir Thomas Darnell and four others, for refusing to subscribe to a forced loan, was sanctioned, the agitation resulting from which was followed by the granting of the Petition of Right.—**Dartmouth College case**, the leading American case (1819) on the vested rights of corporations, reported as Trustees of Dartmouth College v. Woodward (4 Wheaton, 518), deciding that a corporate charter, even though it be a British charter granted before the revolution, cannot be materially altered by a State legislature, it being a contract within the meaning of the provision of the United States Constitution which deprives the State of the power to impair the obligation of a contract.—**Dr. Bonham's case**, an important decision upon English constitutional law, rendered in 1609, in the case of Thomas Bonham v. the College of Physicians (3 Coke, 107), for false imprisonment. It was held that an act of Parliament which is against common right and reason, or is impossible to be performed, is void by the common law; also, that where the power to commit to prison is vested by patent or act of Parliament in parties not being a court, their proceedings ought to be of record, and the facts upon which such power is exercised are traversable.—**Dred Scott case**, a case of great historical importance among the events which preceded the abolition of slavery in the United States, in which the Supreme Court held (in 1857) that a free negro of slave ancestry was not a citizen, and could not sue or be protected as such in the United States courts. The statement that the Africans in America had long been considered a subordinate race having "no rights which the white man is bound to respect," which was contained in the opinion of the chief justice, gained universal attention as a point of attack in the controversy about slavery.—**Five per cent. cases**, a decision of the United States Supreme Court in 1864 (110 U. S., 471), holding that an act of Congress by which a percentage of the proceeds of land "sold by Congress" is reserved to certain public uses of a State does not include lands disposed of by the United States in satisfaction of military land-warrants.—**General case**, in math., that special state of things which is considered when, in studying an analytical expression, it is assumed that there is no peculiar relation between the constants denoted by letters. The general case may be very exceptional. Thus, in linear associative algebra, in the general case the vanishing of a product implies the vanishing of one of the factors, yet among the innumerable possible algebras there are but three in which such an inference is

valid. **Hampden's case**. See *case of shipmoney*, under *shipmoney*. In case, in the event or contingency; if it should so fall out or happen that; supposing.

A sure retreat to his forces, in case they should have an ill day or an unlucky chance in the field.

Bacon, Hist. Hen. VII.

Irreducible case, in math., the case in which a cubic equation has three real roots, when Cardan's method of solution involves imaginaries.—**Kendall's case**, a decision of the United States Supreme Court (1848), noted in American constitutional law, that the court may compel a cabinet officer to perform a ministerial duty.—**Kosztia's case**, the facts and resulting diplomatic correspondence (1851) by which the United States government maintained the claim that Martin Kosztia, a native of Hungary, was entitled to protection as an American citizen from seizure by the Austrian government while in Turkish jurisdiction, he having previously legally declared his intention to become an American citizen.—**Marbury's case**, a decision of the United States Supreme Court (1803), noted in American constitutional history, which established the power of that court to declare an act of Congress void for contravening the United States Constitution, and defined the extent to which members of the cabinet are amenable to the courts.—**McLeod case**, a controversy between the United States and Canada, arising out of the incident of the destruction of the American steamer *Caroline* by the Canadian authorities (1837), in the course of which a man was killed. McLeod was arrested as one of the attacking party, and was indicted (1841) in New York State for murder; but he proved an alibi, and was acquitted. Also called the *case of the Caroline*.—**Negro case**. See *Sommersett's case*, below.—**Shelley's case**, the decision in 1581 (1 Coke, 89, 100), by all the judges of England, of the case of Nicholas Wolfe against Henry Shelley, in ejectment, involving questions upon the law of common recoveries. It is chiefly celebrated for a precise and clear statement by defendant's counsel of a previously well-established rule of law concerning the effect of the word "heirs" in certain conveyances, since known as the rule in Shelley's case. This rule, which is now regarded as a rule of interpretation rather than a rule of law, is to the effect that wherever there is a limitation to a man, which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions), either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate; that is to say, not a gift to the heir, but a gift to the person first named of an estate of inheritance, such as his heir may take by descent.—**Sommersett's case**, a famous habeas corpus case in England in 1772, before Lord Mansfield, brought on behalf of Thomas Sommersett, a negro. It established the principle that a slave brought upon English soil became thereby free. Also called the *negro case*.

—**Special case**, a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing on the facts so stated. In Scots law, in civil jury cases, a special case differs from a special verdict only in this, that the special verdict is returned by the jury, whereas the special case is adjusted by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed without the evidence.—**Taltarum's case**, a noted decision in the English courts in 1473, establishing the power of a tenant in tail to convert the estate into a fee simple absolute by suffering a common recovery.—**Tennessee bond cases**, a name given to seventeen cases decided by the United States Supreme Court in 1886 (114 U. S. Sup. Ct., 663), wherein it was held that the statutory lien upon railroads created by act of the Tennessee Legislature, Feb. 11th, 1852, was for the benefit of the State, and not of the holders of State bonds issued under that act.—**Tichborne case**, also called the *case of the claimant*, the name given to the history and proceedings of Thomas Castro, otherwise Arthur Orton, in his claim to be Sir Roger Tichborne, and heir to the estate and baronetcy of Tichborne in England (1868-74), which he prosecuted by suits in Chancery and in the Courts of Probate and of Common Pleas, and which culminated in his trial and sentence to fourteen years' imprisonment for perjury. The case is celebrated for the conflicting nature of the testimony as to his identity, and for the great public interest excited by it.—**To put the case**, to suppose the event or a certain state of things; state a question, especially in a manner to invite decision.—**Tweed's case**, the proceedings against William M. Tweed and others, known as the Tweed Ring, for frauds perpetrated while they were municipal officers of New York, by which they obtained over six million dollars from the county of New York. In a civil case it was decided by the Court of Appeals of New York in 1874 (People v. Ingersoll, 58 N. Y., 1) that an action for money fraudulently obtained from a county could not be brought in the name of the people of the State. This was subsequently remedied by statute, and a judgment obtained. In a criminal case, Tweed was found guilty on twelve counts for similar offenses in one indictment, and was separately sentenced to one year's imprisonment on each, with the direction that service of one sentence should not begin until the completion of service on a prior sentence. After completing the term of his first sentence, a writ of habeas corpus was served on his jailer, and the Court of Appeals in 1876 (People ex rel. Tweed v. Liscomb, 60 N. Y., 559) decided that, under the statutes conferring the power to sentence, cumulative sentences in such cases were not lawful, and discharged him; but he was immediately imprisoned in default of bail in preceding civil suits. Other minor decisions on questions of procedure are also included under this term.—**Twyne's case**, the leading case in English law (1603) holding that a conveyance intended to defraud creditors is void as against them, if not taken in good faith and for valuable consideration.—**Tyrrrel's case**, a noted decision in English law (1558), in which after Parliament, by the statute of uses, had thought to put an end to the holding of land in the name of one person to the use of another, the courts introduced the doctrine of a use upon a use, leading to the present law of trusts.—**Virginia coupon cases**, the generic name under which are known a number of suits determined by the United States Supreme Court in 1884, enforcing a Virginia statute which declared coupons on bonds of that State receivable in payment of State taxes, notwithstanding

the repeal of that statute.—**Wheeling bridge case**, the case of Pennsylvania v. Wheeling and Belmont Bridge Co., decided by the United States Supreme Court (in 1851 and 1855), concerning a bridge across the Ohio river at Wheeling, Virginia. caste (kást), *n.* [Formerly *cast*, only recently as *F. caste*, < Pg. *casta* (> Sp. *casta*), breed, race, caste; first applied to the classes of the Hindus by the Portuguese, who were the earliest colonists in India; prop. fem. of *casto*, < L. *castus*, pure, > OE. *chaste*, E. *chaste*, q. v.] 1. One of the artificial divisions or social classes into which the Hindus are rigidly separated according to the religious law of Brahmanism, and of which the privileges or disabilities are transmitted by inheritance. The principal castes are four in number: 1st, the Brahmans, or the sacerdotal caste; 2d, the Kshatriyas, modern Rajputs, or military caste; 3d, the Vaisyas, or husbandmen and merchants, who have now in many districts become merged in the second and fourth castes; 4th, the Sudras, or laborers and mechanics. The Brahmans are supposed to have sprung from the mouth of Brahma, the Kshatriyas from his arms, the Vaisyas from his belly and thighs, and the Sudras from his feet. The Brahman represents religion; the Kshatriya, war; the Vaisya, commerce and wealth; and the Sudra, labor. There are many subdivisions of caste, and although the Sudras are degraded far below the Brahmans, Kshatriyas, and Vaisyas, there are reckoned thirty-six subdivisions lower than the Sudras. Lowest of all are the Pariahs, who are supposed to be of no caste, and mere outcasts from humanity. Of the castes, the first three are the natural and gradually established divisions of the Aryan invaders and conquerors of India; the fourth was made up of the subjugated aborigines. The Sanskrit name for caste is *varna*, color, the different castes having been at first marked by differences of complexion, according to race, and in some degree according to occupation and consequent exposure. Besides the original castes, numerous mixed classes or castes have sprung up in the progress of time, and are dependent upon trade, occupation, or profession; in fact, the essential principle in the system of caste is the confining of employments to hereditary classes. Castes are, according to Indian social standards, either "high" or "low." The same term is also used of somewhat similar classes in other countries.

The system of caste involves the worst of all wrongs to humanity: that of hallowing evil by the authority and sanction of religion. *Faiths of the World*, p. 30.

To be subjugated by an inferior caste was a degradation beyond all other degradation. *Macaulay*, Hist. Eng.

Offensive as is the low-caste Indian, . . . I had rather see the lowest Pariahs of the low, than a single trim, smooth-faced, smooth-waved, clever high-caste Hindoo on my lands or in my colony. *W. G. Palgrave*, in *Fortnightly Rev.*

Hence—2. A division of society, or the principle of grading society, according to external conditions; a class or grade separated from others by differences of wealth, hereditary rank or privileges, or by profession or employment.

Where the operations became hereditary, a system of castes arose. This system has never been rigid in Western Europe, however, as it has been in India and other countries of the East.

Her manner had not that repose Which stamps the *caste* of Vere de Vere. *Tennyson*, Lady Clara Vere de Vere.

The question is not yet settled whether they [elevations and subsidences] were of a slow and gradual nature like some now in progress, or whether, like others that have occurred in connection with earthquakes, they may have been rapid and *cataclysmal*.

J. W. Dawson, Nature and the Bible, p. 161.

2. A decomposition and new combination supposed by Berzelius and other chemists to be produced among the proximate and elementary principles of one or more compounds, by virtue of the mere presence of a substance or substances which do not of themselves enter into the reaction. It is at present believed that bodies which cause catalysis do in some way take part in the chemical reactions involved, though they are in the course of it always brought back to their original condition.

I am strongly disposed to consider that the facts of *Catalysis* depend upon voltaic action, to generate which three heterogeneous substances are always necessary.

The arrangement of actions or interconnection of causes which constitutes the final event of a dramatic piece; the unfolding and winding up of the plot, clearing up difficulties, and closing the play; the dénouement. The ancients divided a play into the protasis, epitasis, catatasis, and catastrophe; that is, the introduction, continuance, heightening, and development or conclusion.

Pat, he comes, like the *catastrophy* of the old comedy. *Shak.*, *Learn*, I, 2.

All the actors must enter to complete and make up the *catastrophy* of this great piece.

Sir T. Browne, *Religio Medici*, I, 47.

The *Catastrophe* of the Poem is finely prepared on this occasion.

The *catastrophy*, indeed the whole of the last act, is beautifully written. *Gifford*, *Int. to Ford*, p. xxiv.

2. A notable event terminating a connected series; a finishing stroke or wind-up; specifically, an unfortunate conclusion; hence, any great calamity or disaster, especially one happening suddenly or from an irresistible cause.

Here was a mighty revolution, the most horrible and portentous *catastrophy* that nature ever yet saw.

Woodward, *Ess. towards a Nat. Hist. of the Earth*.

He fell, but one sufferer in a common *catastrophy*. *W. Phillips*, *Speeches*, p. 6.

3. In *geol.*, an occurrence of geological importance not in harmony with preceding events, and not the result of causes acting always in a given direction; a cataclysm. It was once generally believed that the earth has "undergone a succession of revolutions and aqueous *catastrophy*s interrupted by long intervals of tranquillity" (*Lyell*). The deluge was one of these great *catastrophy*s. A similar view is the once common idea that all the living organisms on the earth's surface had been again and again exterminated, to be succeeded by new creations of plants and animals.

Great changes of a kind and intensity quite different from the common course of events, and which may therefore properly be called *catastrophy*s, have taken place upon the earth's surface. *Howell*.

The old notion of all the inhabitants of the earth having been swept away by *catastrophy*s at successive periods, is very generally given up, even by those geologists, as *Élie de Beaumont*, *Murchison*, *Barraude*, etc., whose general views would naturally lead them to this conclusion.

Darwin, *Origin of Species*, p. 269.

Theory of catastrophes. See *theory of cataclysms*, under *cataclysm*. **Syn.** 2. *Disaster*, *Calamity*, etc. (see *misfortune*); consumption, finale.

The hypothesis of uniformity cannot possess any essential simplicity which, previous to inquiry, gives it a claim upon our assent superior to that of the opposite *catastrophy*c hypothesis.

Howell.

3. Subversive in a momentous degree of settled usage or law.

The *catastrophy* creation of Piers for the purpose of swamping the upper house is . . . a power only to be used on great occasions, when the object is immense, and the party strife unmitigated.

Bagshot, *Eng. Const.* (Boston ed.), p. 305.

catastrophism (ka-tas'trō-fizm), *n.* [*catastrophy* + *-ism*; = F. *catastrophisme*.] The theoretical view of geological events which has as its essential basis the idea of a succession of catastrophes; the opposite of *uniformitarianism*. See *catastrophy*, 3, and *cataclysm*, 2.

I find three, more or less contradictory, systems of geological thought, each of which might fairly enough claim these appellations, standing side by side in Britain. I shall call one of them *Catastrophism*, another *Uniformitarianism*, the third *Evolutionism*. By *Catastrophism*, I mean any form of geological speculation which, in order to account for the phenomena of geology, supposes the operation of forces different in their nature, or immeasurably different in power, from those which we at present see in action in the universe. *Huxley*, *Lay Sermons*, p. 229.

catastrophist (ka-tas'trō-fist), *n.* [*catastrophy* + *-ist*.] One who believes in catastrophism; a cataclysmist. The term is used in geology by writers on the theoretical dynamic geology as the opposite of *uniformitarian*, that is, of one who considers that geological causes now in action are, and have been, essentially the same from the beginning. The catastrophist maintains that there have been catastrophes, or sudden violent changes in the order of nature, such, for instance, as would cause the extermination of all forms of life upon the globe, or cover it with ice.

The *catastrophist* is affirmative, the uniformitarian is negative in his assertions. *Howell*.

For a generation after geologists had become uniformitarians in Geology, they remained *catastrophists* in Biology. *H. Spencer*, *Data of Ethics*, § 17.

The larval skin is then thrown off, and the insect remains quiescent for some time, the imago or perfect insect forming beneath the pupal envelop. Caterpillars generally feed on leaves or succulent vegetables, and are sometimes very destructive. See *larva*.

Catholic in Greek signifies universal: and the Christian Church was so called, as consisting of all Nations to whom the Gospel was to be preached, in contradistinction to the Jewish Church, which consisted for the most part of Jews only. *Milton*, *True Religion*.

(b) [*cap.*] Constituting, conforming to, or in harmony with the visible church, which extended throughout the whole Roman empire and adjacent countries, possessed a common organization and a system of intercommunion, and regulated disputed questions by ecumenical councils, as distinguished from local sects, whether heretical or simply schismatic, but especially from those which did not accept the decrees of ecumenical councils: as, the *Catholic Church*; the *Catholic faith*. In this sense it is regularly applied to the ancient historical church, its faith and organization down to the time of the great schism between the sees of Rome and Constantinople: as, a *Catholic* bishop or synod, as distinguished from a Nestorian or Jacobite prelate or council.

The importunity of heretics made them [the Church of Christ] add another name to this [Christian], viz., that of *catholic*; which was, as it were, their surname or characteristic, to distinguish them from all sects, who, though they had party names, yet sometimes sheltered themselves under the common name of Christians. *Bingham*, *Antiq.*, i. i. § 7.

The test of *Catholic* doctrine, the maintenance of which distinguishes the *Catholic Church* in any place from heretical or schismatical communions, has been described as that which has been taught always, everywhere, by all. *Bunt*, *Theol. Dict.* (Episcopal).

(c) [*cap.*] Historically derived from the ancient undivided church before the great schism, and acknowledging the decrees of its councils as recognized by the Greek or Eastern Church. The official title of that church is, The Holy Orthodox *Catholic* Apostolic Oriental Church (*ἡ ἁγία ὀρθόδοξος καθολικὴ ἀποστολικὴ ὀριαντικὴ ἐκκλησία*). (d) [*cap.*] Claiming unbroken descent (through the apostolic succession) from and conformity to the order and doctrine of the ancient undivided church, and acknowledging the decrees of its councils as received by both the Greek and the Latin Church. In this sense the word *Catholic* is applied by Anglican writers to their own com-

munion. (e) [*cap.*] Claiming to possess exclusively the notes or characteristics of the one, only, true, and universal church—unity, visibility, indefectibility, succession, universality, and sanctity: used in this sense, with these qualifications, only by the Church of Rome, as applicable only to itself and its adherents, and to their faith and organization; often qualified, especially by those not acknowledging these claims, by prefixing the word *Roman*. (f) More specifically, an epithet distinguishing the faith of the universal Christian church from those opinions which are peculiar to special sects. (g) A designation of certain of the epistles in the New Testament which are addressed to believers generally and not to a particular church. The catholic epistles are James, Peter I. and II., John I. and Jude. John II. and III. are also usually included. (h) Belonging as property to the church at large, as distinguished from a parish or a monastic order: in ancient ecclesiastical literature used to designate certain church buildings, as a bishop's church in contrast with a parish church, or a parish church which was open to all in distinction from monastic churches.—**Catholic apostolate**. See *apostolate*.—**Catholic Apostolic Church**. See *Irrevent*.—**Catholic creditor**, in *Sol's law*, a creditor whose debt is secured over several subjects, or over all the subjects belonging to his debtor. **Catholic Majesty**, a title or style assumed by the kings and queens of Spain. It was conferred by the pope as a recognition of devotion to the Roman Catholic religion, and was first given to the Asturian prince Alfonso I., about the middle of the eighth century.

II. *n.* 1. [*cap.*] A member of the universal Christian church.—2. [*cap.*] A member of the Roman Catholic Church.—3. Same as *catholicos*.

The orthodox monarchs of Georgia and Abkhazia each supported his own *Catholic*. *J. M. Neale*, *Eastern Church*, i. 9.

Catholic Emancipation Act, an English statute of 1829 (10 Geo. IV., c. 7), repealing former laws which imposed disabilities upon Roman Catholics, and allowing them (except priests) to sit in Parliament, and to hold civil and military offices with certain exceptions. The measure was urged with special reference to the Roman Catholics of Ireland.

Old Catholics. (a) The name used by a small body of believers in Januarius in Holland, with an archiepiscopal see in Utrecht. They have continued since 1723 to recognize the authority of the pope by sending him notice of each new election of a bishop, which he always disregards. (b) A reform party in the Roman Catholic Church, founded after the proclamation of, and in opposition to, the dogma of papal infallibility proclaimed by the Vatican Council in 1870. A schism with the Roman Catholic Church was not intended, but it resulted; the leaders were excommunicated and new congregations formed. No bishop having joined the movement, the ordination of a bishop was obtained from the Old Catholic bishop of Devon in Holland. Old Catholics have departed in few respects from their former ecclesiastical customs as Roman Catholics. Auricular confession and fasting are, however, voluntary with them, and priests are allowed to marry. Mass is permitted to be said in the vernacular. They are found chiefly in Germany and in Switzerland, where they call themselves *Christian Catholics*.—**Roman Catholic Relief Acts**, a series of English statutes removing the political disabilities of Roman Catholics: as, 1829 (10 Geo. IV., c. 7), permitting them to sit in Parliament and to hold offices, with certain exceptions; 1833 (3 and 4 Wm. IV., c. 102), enabling their clergymen to celebrate marriages between Protestants, etc., extended to Scotland in 1834 (4 and 5 Wm. IV., c. 28); 1843 (6 and 7 Vict., c. 28), abolishing a certain oath as a qualification for Irish voters; 1844 (7 and 8 Vict., c. 102) and 1846 (9 and 10 Vict., c. 59), repealing statutes against them; 1867 (30 and 31 Vict., c. 62), abolishing the declaration against transubstantiation, etc., and (*id.*, c. 75) making all subjects eligible to the office of lord chancellor of Ireland. The term also includes the Promissory Oaths Act, 1868 (which see, under *oath*).

CD, DE, EF, FC, AF, AD, BC, are stiff bars joined at A, C, D, E, F. A and B are fixed in position at a distance equal to BC, and there is a pencil at E. As C turns about F, describing the arc *cc'*, the point E describes the right line *Ee'*; *cde* and *c'de'* are two positions of CDE.

For use, the junction, A, of the two long links is fixed in position, and an extra link, EC, is attached to the angle of the rhombus nearest to A. The other end, B, of the extra link is fixed in position, usually at a distance from A equal to EC. In this case, when EC turns about B as a center, the vertex, E, of the rhombus most distant from A will describe a right line. The production of this effect by link-work alone had been much sought after since the invention of the steam engine. *Principal cells*, the central cells of the cardiac glands of the stomach. Also called *adelomorphous cells*. *Selenium cell*. See *resistance and photophone*.
